M46-202 and M46-206 LINE PRINTER CONTROLLER PROGRAMMING MANUAL

GENERAL DESCRIPTION

The M46-206 Line Printer Controller is designed to operate with a family of printers. These printers have a common interface specification differing only in print speed, power requirements, cabinet styling, and the arrangement of buttons on the Control Panel. INTERDATA part numbers have been assigned to two controllers for this family of printers, namely: M46-202 and M46-206. The M46-202 Line Printer Controller is designed to operate the Centronics Model 101 Line Printer and other equivalent printers capable of printing 60-200 LPM.

These Printers feature a full line (132 character) buffer, an 8 channel VFU (Vertical Format Unit). They print 64 characters per column according to the 7-bit ASCII code at 10 characters per inch. Line spacing is 6 lines per inch.

The Controller performs a modest amount of code conversion in order for the Controller/Printer combination to be compatible with existing INTERDATA test and driver programs. Characters may be loaded into the Printer Buffer via the Controller at speeds up to 200K bytes/second for the M46-206 and 75K bytes/second for the M46-202.

In the following sections, the definitions and procedures apply to both models of controllers. Refer to the Operators Manual, supplied with the Printer, for details on a specific model. Table 1 provides a cross-reference of the Line Printers to their respective Controllers by Marketing part number.

TABLE 1. LINE PRINTER TO CONTROLLER CROSS REFERENCE

LINE PRINTER	CONTROLLER	
MARKETING NUMBER	MARKETING NUMBER	PART NUMBER
M46-204 (200 LPM) M46-205 (200 LPM) (50 HZ VERSION)	M46-202 (7" BOARD)	02-244
M46-207 (200 LPM) M46-208 (200 LPM) (50 HZ VERSION) M46-209 (600 LPM) M46-210 (600 LPM) (50 HZ VERSION)	M46-206 (7" BOARD)	02-307

CONFIGURATION

The M46-206 and M46-202 Line Printer Controller and the associated Printer can be installed on the Multiplexor Channel Bus or the Selector Channel Bus of any INTERDATA Processor. See the Section on Interrupts concerning priority on the I/O Bus.

OPERATING PROCEDURES

Control Panel Switches and Indicators

The following is a list of Control Panel Switches and Indicators and their descriptions.

	M46-204 AND M46-205 LINE PRINTERS	M46-207, M46-208, M46-209, AND M46-210 LINE PRINTERS
Power	ON/OFF - This latching switch/indicator turns power ON or OFF to the Printer. It lights in the ON position.	Power On-Indicating Switch. Depressing this switch turns ON primary power in the Printer and lights the switch indicator lamp. Power Off-Indicating Switch. Depressing this switch turns OFF primary power in the Printer and lights the switch indicator lamp.
On Line/ Off Line	SELECT - This latching switch/indicator turns the Printer ON Line or OFF Line. It lights in the SELECT (On-Line) position.	Run-Indicating Switch. Depressing this switch enables print commands and lights the switch indicator lamp. Stop-Indicating Switch. Depressing this switch inhibits print commands and lights the switch indicator lamp.
Paper Advance	Top Of Form – This momentary action switch causes the paper to be advanced to the top of forms punch on the built-in Vertical Forms Control tape reader.	Home-Switch. Depressing this switch sets the paper feeding system to the Home condition and each time this switch is depressed, one paper form length is advanced through the Printer mechanism. This switch can also be used to eject paper forms at the end of a run. This switch is operable only when the STOP indicator is lit. One-Line Switch. Depressing this switch advances the paper form through the Printer one line-at-a-time, each time the switch is depressed. The switch is operable only when the STOP indicator is lit. Slew-Switches. Depressing the Home and One Line Switches together advances the paper form through the printer mechanism at the paper slew rate of 27.5 inches/second as long as both switches are depressed. These switches are operable only when the STOP indicator is lit.
Paper Empty	Forms Override – This momentary action switch resets the Paper Empty condition and allows printing to continue even after a Paper Empty condition is sensed by the Printer. Paper Out – This indicator lights when a Paper Empty condition is sensed by the Printer. This condition is cleared by loading more paper in the Printer or by depressing the FORMS OVERRIDE switch. Forms Thickness Control - This is used to adjust the clearance between the platen and the face of the print head assembly according to the thickness of the paper being used. For this adjustment, refer to the Technical Manual supplied with each Printer.	Tractor Position Knobs. Rotation of these knobs moves the paper feed tractors sideways. Form Thickness Knobs. These graduated and detented knobs are rotated to adjust the spacing between the print drum and print hammers to accommodate different forms and ribbons.

NOTE

The numbers on the knobs do not refer to the number of parts in the form.

Character Align Lever. Used to advance or retard activation of the print hammers with respect to the position of the characters on the spinning print drums as they pass the print hammers.

Latch Lever. Used to latch and unlatch the yoke.

Alarm-Indicator. This indicator lamp is lit when any of several fault conditions exist. The fault conditions which can be corrected by the machine operator are:

- Yoke-Closed Interlock Switch not closed.
- Yoke-latched Interlock Switch not closed.
- Blown Motor Fuse

Alarms **Hardware Alarm** – This indicator lights if the printer’s printing head carriage travels beyond the right-most allowable margin. This happens only if a malfunction occurs within the Printer. The Hardware Alarm condition is cleared by resetting the Safety Limit switch (located at the right side of the Printer carriage assembly), and by depressing the SELECT switch. Note that repeated occurrence of a Hardware Alarm condition indicates a need for maintenance to be performed on the Printer.

Control Knobs/Levers **Paper Feed Lever** – This lever, located on the right top of the Printer, is used for rapidly feeding paper in the forward direction.

Paper Advance Knob – This knob, located on the left side of the Printer, is used to adjust the paper position (forward and backward) relative to the Vertical Forms Control punched tape.

Infinite-Form-Position Control. When the lever of this control is unlatched, the knob may be rotated to adjust the vertical position of the form, when the stop indicator is illuminated and the paper is stationary.

Vertical-Form-Position Lever. This lever is used to adjust the location in the vertical direction of the print line with respect to pre-printed forms, when the run indicator is lit and the paper is being indexed during normal printing operations.

Vertical Form Unit

The Printer is equipped with an eight-channel vertical forms control feature which uses standard one inch punched tape, 10 punches per inch, as the control element. The tape is inserted into a reader which is located on the left side of the Printer. The tape format is shown in Figure 1.

Figure 1. Tape Format

DATA FORMAT

The Controller transmits all upper case codes from X'20' to X'5E' to the Printer without conversion. Note that X'5E' prints as ^ (circumflex) and the code X'5F' (underline) is trapped and converted to X'3C' which prints as < (less than). All lower case codes, X'60' through X'7F', are converted and transmitted as X'40' through X'5F'. Note that the "underline" is printed when the Processor sends X'7F' to the Controller (M46-206) and that character X'7F' is treated as a Carriage Return (CR) in the M46-202 Controller.

M46-202 Controller

Non-printing codes X'00' through X'1F' are ignored with the following exceptions:

BELL (X'07')	This causes the Audio alarm to sound for approximately two seconds.
LF (X'0A')	This causes the paper to be advanced one line.
VT (X'0B')	This causes the paper to be advanced to Channel 5 of the vertical format tape.
FF (X'0C')	This causes the paper to be advanced to Channel 7 of the vertical format tape.
CR (X'0D')	This causes the Line Buffer to be printed, the print head carriage to be returned to the left margin, and the paper to be advanced one line.
SO (X'0E')	This causes the entire contents of the current line to be printed in expanded character size (0.20 inches center to center horizontally instead of 0.10 inches), allowing only 66 characters per line. The X'0E' character may be sent at any time in the course of loading the Line Buffer.

M46-206 Controller

Non-printing codes X'00' through X'1F' are undefined with the following exceptions:

LF (X'0A')	This causes the Line Buffer to be printed and the paper to be spaced one line, even if given after a Carriage Return (CR).
VT (X'0B')	This causes the Line Buffer to be printed and the paper to be spaced according to Channel 4 of the VFU tape, even if given after a CR.
FF (X'0C')	This causes the Line Buffer to be printed and the paper to be spaced according to Channel 8 of the VFU tape, even if given after a CR.
CR(X'0D')	This causes the Line Buffer to be printed. The paper is spaced according to the <i>next character</i> in the following manner:
X'01'	Single Space
X'0A'	Single Space
X'0B'	VFU Channel 4
X'0C'	VFU Channel 8
X'40' - X'77'	Space 00 to 55 lines
X'78' - X'7F'	Space according to VFU Channels 1 through 8.

If the character following CR is not part of the above list, the Controller sends the code for space 00 lines - i.e., no space. The next time the Line Buffer is printed, over printing occurs. This may or may not be deliberate.

The Carriage Return (CR) 01 sequence can be used with the 02-244 (M46-202) and the 02-307 (M46-206) Controller.

PROGRAMMING INSTRUCTIONS

Status and Command Bytes

Table 2 provides Status and Command Byte Information.

TABLE 2. LINE PRINTER CONTROLLER STATUS AND COMMAND BYTE DATA

BIT NUMBER	0	1	2	3	4	5	6	7
STATUS BYTE		PAPER EMPTY		*INTER-LOCK	BUSY	EX		DU
COMMAND BYTE	DISABLE	ENABLE						

DISARM
*M46-202 ONLY

STATUS

- PAPER EMPTY** This bit is set when the Paper Empty condition is activated in the Printer. This condition also sets the EX bit.
- INTERLOCK** This bit is set when the Printer carriage assembly overruns the allowable length of travel. This is a result of a hardware fault condition. This condition also sets the Busy bit.
- BUSY** This bit is set when the Interface is not ready to accept a character. It may be caused by a functional Printer operation or by the Interlock or Paper Empty condition. When this bit is reset, an interrupt is generated.
- EX** This bit is set when either the Paper Empty or Interlock bit is set.
- DU** This bit is set when the Printer is not selected (Off-Line), or if power is OFF. An interrupt is generated if this bit changes state in either direction.

COMMAND BYTE

- DISABLE** This bit set and ENABLE bit reset allows an interrupt to be queued without interrupting the Processor.
- ENABLE** This bit set and DISABLE bit reset allows the Interface to interrupt the Processor. (See INTERRUPTS).
- DISARM** With both DISABLE and ENABLE bits set, the interrupt system is DISARMED. Interrupts are not generated or queued.

INSTRUCTIONS

- OUTPUT COMMAND (OC or OCR)** The Interface may be Enabled, Disabled or Disarmed with this command.
- SENSE STATUS (SS or SSR)** This instruction returns status of the Controller.
- WRITE DATA (WD or WDR)
WRITE BLOCK (WB or WBR)** These instructions are used to output characters to the Printer and cause BUSY → 0.
- READ DATA (RD or RDR)** This instruction is ignored by the Printer.
- ACKNOWLEDGE INTERRUPT (AI or AIR)** If the Printer is Enabled, this instruction examines the Status bits when an interrupt is generated. This instruction is valid on 16-Bit Processor only.

PROGRAMMING SEQUENCES

The following is a brief description of different modes of operation. See 16-Bit and 32-Bit Reference Manuals, Publication Numbers 29-298 and 29-365, for general Programming Procedures.

Sense Status I/O Control

This form of I/O Programming uses loops to continually interrogate the status of a device until a specified condition is met. (See Appendix 2 and 3 for Programming Examples.)

Interrupt I/O Control

16 Bit Processor

When using immediate interrupts on a 16 Bit Processor, the appropriate service pointer table must be set up to accommodate a PSW swap. Refer to Appendix 2 for a Programming Example.

32-Bit Processor

Interrupts are handled through the interrupt service pointer table (See Appendix 3 for Programming Example).

Auto Driver Channel I/O (32-Bit Processor Only)

The purpose of the Auto Driver Channel is to free the user from handling every interrupt. The Auto Driver Channel's function is controlled by the set up of the Channel Command Block. See Appendix 3 for Programming Examples.

INTERRUPTS

When interrupts are enabled, the Interface generates an interrupt when:

1. The Busy bit changes from ONE to ZERO.
2. The Paper Empty bit changes from ZERO to ONE.
3. The DU bit changes state in either direction.

NOTE

Since writing out a character causes Busy to change to ZERO, an efficient way to cause an interrupt is to write a null character.

NOTE

When the Line Printer is disabled, the interrupt is queued. When the Line Printer is disarmed, interrupts are not generated or queued.

NOTE

When running in an interrupt environment, the Line Printer, because of its rapid response, should be a lower priority than slower responding devices. If not, the Line Printer should be programmed via status loops with Processor interrupts enabled.

INITIALIZATION

When the Processor is initialized, the Line Printer Controller is disconnected from the Multiplexor Bus, the Busy status bit is reset, and interrupts are disarmed. The Printer is initialized (the Line Buffer reset) either by turning the power ON (ON/OFF switch) to the Printer, or by depressing the SELECT switch.

DEVICE NUMBER

The 02-307 or 02-244 preferred device number is X'62'. See the 16-Bit and 32-Bit Reference Manuals, Publication Numbers 29-398 and 29-365.

SAMPLE PROGRAMS AND FLOW CHARTS

Appendix 2 contains 2 Programming Examples for 16-Bit Processors. The first is a sample program and flowchart for all 16-Bit Processors to output a buffer of characters to the Printer using programmed Sense Status Loops.

The second is a sample program and flowchart for all 16-Bit Processors showing output to the Printer under Immediate Interrupt Control.

Appendix 3 contains three programming examples for 32-Bit Processors. The first is a sample program for all 32-Bit Processors to demonstrate output to the Printer using Sense Status Loops.

The second is a sample program and flowchart for all 32-Bit Processors to demonstrate output to the Printer under Interrupt Control.

The third is a sample program and flowchart for all 32-Bit Processors to demonstrate output to the Printer using the Auto Driver Channel.

**APPENDIX 1
CHARACTER DEFINITION TABLE**

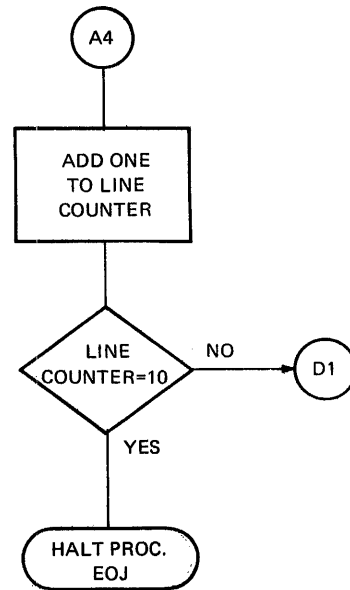

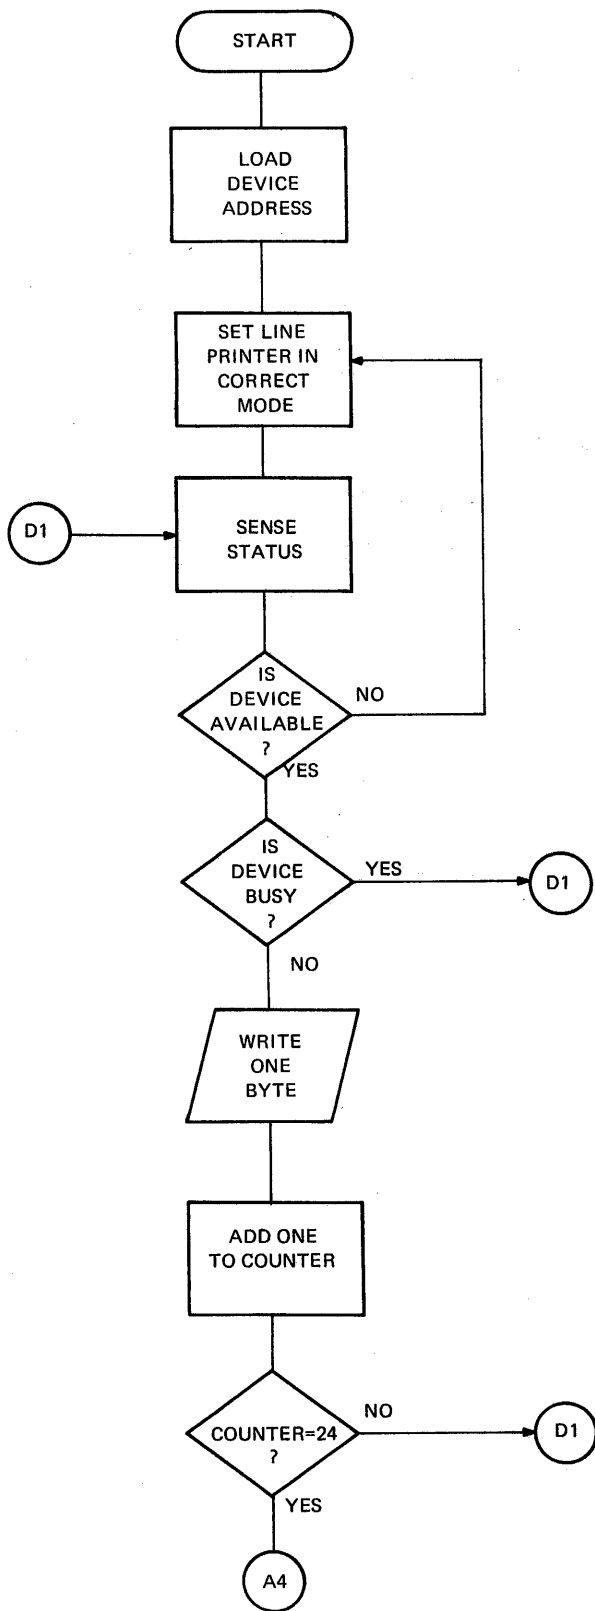

The following differences exist between all the printers.

<u>Printer</u>	<u>Character</u>	<u>Prints</u>
M46-204	5E	↑
M46-205	5E	↑
M46-207	5E	^
M46-208	5E	^
M46-209	5E	^
M46-210	5E	^
M46-204	5F	< (3C)
M46-205	5F	< (3C)
M46-207	5F	< (3C)
M46-208	5F	< (3C)
M46-209	5F	< (3C)
M46-210	5F	< (3C)
M46-204	7E	↑
M46-205	7E	↑
M46-207	7E	^
M46-208	7E	^
M46-209	7E	^
M46-210	7E	^
M46-204	7F	CR
M46-205	7F	CR
M46-207	7F	—
M46-208	7F	—
M46-209	7F	—
M46-210	7F	—

All Controllers convert X'60' thru X'7E' to X'40' thru X'5E'. M46-202 ignores all characters below X'20', and for the M46-206 all characters below X'20' are undefined.

<u>Printer</u>	<u>Character Given After (CR(OD))</u>	<u>Results</u>
M46-206	20-3F	Undefined
M46-206	40-77	Spaces 0 thru 55 lines
M46-206	78	Spaces to Channel 1
M46-206	79	Spaces to Channel 2
M46-206	7A	Spaces to Channel 3
M46-206	7B	Spaces to Channel 4
M46-206	7C	Spaces to Channel 5
M46-206	7D	Spaces to Channel 6
M46-206	7E	Spaces to Channel 7
M46-206	7F	Spaces to Channel 8
M46-206	01	Spaces 1 line
M46-202	01	Ignored
M46-206	LF(0A)	Causes buffer to print and space 1 line.
M46-202	LF(0A)	Causes paper to space 1 line.
M46-206	VT(0B)	Causes buffer to print and space to Channel 4.
M46-202	VT(0B)	Causes buffer to advance to Channel 5.
M46-206	FF(0C)	Causes buffer to print and space to Channel 8.
M46-202	FF(0C)	Causes paper to advance to Channel 7.
M46-206	CR(0D)	Causes buffer to print and advance on next character.
M46-202	CR(0D)	Causes buffer to print and space 1 line.
