The Aussie Mag for Amstrad owners

THE AMSTRAD USER

Issue No. 24 $3.75 January [illegible]

- *Follow-up of the major Software Guide for PCW owners + MasterMind program + a look at GEM on the PC*
- *Reviews on Rainbird's Art Studio and Advanced Music System + four more pages of Cheats*
- *Three type-ins for CPCs + User Groups + heaps more*

FOR THE NOVICE & EXPERIENCED USER

Registered by Australia Post – Publication No VBP7017

THE AMSTRAD USER

Serious Side

Issue No. 24
January 1987

For Tape subscribers, the programs can be found at the following approximate positions:
Side 1: **MENU464** - 10, **MENU6128** - 23, **LOCO2** - 35, **ADENCODE** - 50 Side 2: **PERSONAL** - `10 (8 blocks)

All enquiries and contacts concerning this Publication should be made in the first instance by writing to The Amstrad User, Suite 1, 245 Springvale Road, Glen Waverley, Victoria 3150, Australia. Urgent matters can be phoned through on (03) 233 9661.
The Amstrad User is normally published on the first working day of each month.

The single copy price of $3.75 is the recommended retail price only.
The subscription rate (for Australia) is $37.50 for 12 issues of the magazine only, or $80.00 for 12 issues of the magazine plus tape (for CPC range only) containing programs appearing in that issue. Postage is included in the above prices. For subscriptions to New Zealand, PNG, Solomon Islands or Vanuatu please add $21 airmail. Other overseas prices available upon application.

Please note that whilst every effort is made to ensure the accuracy of all features and listings herein, we cannot accept any liability whatsoever for any mistakes or misprints.
Contributions are welcome from readers or other interested parties. In most circumstances the following payments will apply to published material: Letters $5.00, Cartoon $5.00 and a rate of $10.00 per page for programs, articles etc. Contributions will not be returned unless specifically requested coupled with a suitable stamped and return addressed padded bag (for tapes or discs).

The Amstrad User is an independent Australian magazine and is not affiliated in any way with Amstrad or their Australian distributors Mitsubishi Electric AWA Pty Ltd., or any other dealer in either software or hardware.

THE AMSTRAD USER

G'day,

As you read this issue of The Amstrad User, my family and I will be basking in the sunshine (I hope!) somewhere in the northern region of Victoria, making up for the lost weekends and late nights which these days always seem to be a necessary part of magazine publishing.

We will be entering our third year next month and looking back over the first two, your magazine has gone from strength to strength. That's not just my own assessment, but is echoed in the many letters regularly received in the office. Not many of them get published, but the words of encouragement and advice are always welcomed and appreciated.

Unlike the early days, there is now a steady stream of CPC program contributions arriving, yet as I have said before, it's never enough! More general articles hints wouldn't go amiss either. PCW owners on the other hand are too quiet (perhaps shy?) and I have yet to discover the means to unlock that source. Any suggestions?

The few people who still think that Amstrad computers were a "flash in the pan" can surely be left in no doubt that, with profits increasing by 273% to $165 million (£75 million), Alan Sugar knows which side of his bread is buttered. 350,000 PCWs and 650,000 CPCs were sold world wide to the end of June 1986 - 57% of these were exported by his UK company. The new PC1512 has already attracted well over 100,000 orders within the first two months of release!

The popularity of your magazine has followed a similar path, monthly sales having nearly tripled compared with January 1986. The Amstrad User has unquestionably the largest circulation of any other Amstrad magazine, imported or otherwise, even though it lacks the colourful, showy, multi-ad style of it's "competitors" - strange, but true.

1987 promises to be an even better year !

See you next month,

Ed

Don't forget: we are back in the office on 12th January 1987.

Letters

All correspondence published in this section earns a payment of five dollars.
Letters should be addressed to The Editor, The Amstrad User, Suite 1, 245 Springvale Road, Glen Waverley, Victoria 3150.
We regret that we cannot enter into any personal correspondence.

Congratulations! Congratulations! At last an Amstrad Magazine with articles and programs I can understand. I "use" an 8512. By the time the two handbooks were studied my poor brain was saturated with names and jargon, with a disappointing amount of practical knowhow.

The November edition of the Amstrad User is EXCELLENT. The "Wordcounter" is not only useful, but demonstrates the uses of some commands and notations. It was a very useful exercise to deduce that the omission of a single 's' made the program inoperative.

Thank you Mr. Goldman for your "Super" program, especially the section, "How it Works". You have helped me a great deal to understand what is generated by program instructions, and why.

Would it be possible to have a series of articles similar to "CP/M Revisited", but, written for 8256 and 8512 users?

H. Ball, Herons Creek, N.S.W

Thank you for your kind words, and congratulate yourself for finding our 'deliberate mistake' in the Wordcounter program. OK, perhaps it wasn't deliberate, but for those who are still scratching their heads, the missing 's' occurred in line 110. More clues? It's after the THEN command. You want it exactly? The line should read IF c$=" " AND inwd% THEN wds%=wds%+1: inwd%=0.

In reply to R. Baxter's letter in the November issue, in which he was having difficulty in finishing the game Fu Kung in Las Vegas.

In the first level, as in all the others, you will see an arrow pointing in a direction, all you need to do is safely walk through it to progress.

I have also had trouble at finishing level no. 9. It seems impossible, any clues?

A. Craddock, Narrabri, N.S.W

I have recently purchased an Amstrad PCW 8512. I would like to ask if any reader or user group has configured 'modem 7' to run on this machine with the Amstrad interface unit. Alternatively, where can I obtain details of the 'calls' which control the interface parameters from within a program so that I can configure it myself.

I am Treasurer of the 1st Acondobolin Scout Group and am currently writing a program to manage the books on the PCW. If anyone has already done it, or is interested in the results, I would like to hear from them.

A.G. Palmer, 17 McGregor Street, Acondobolin, N.S.W

I would appreciate some advice from any of our readers about solving "The Never-ending Story" adventure - unfortunately for me it ends all to quickly!

It's a promising game but a little frustrating to find I can't progress past "The Swamps of Sadness" without becoming permanently "Bogged-down"!

Also, could you please tell me what kind of articles you are seeking for submission to this magazine, and if general users and readers such as I would be eligible to contribute?

K. Rigby, Para-Hills, S.A

MAILBAG

A majority of the articles and programs published in The Amstrad User are from "general users and readers" and are always welcome. We don't stipulate what should be submitted, but as a guide it should be something you feel would be of interest to other users (and that goes for PCW owners as well) and which has not been covered recently, say, over the last twelve months. Reviews, specialist articles and programs are the norm, but we are open to any other ideas.

The only thing we do stipulate is that, in respect of program submissions, the software is fully documented and tested and sent to us on a tape or disc with accompanying description and running instructions. If you need the tape or disc back, also enclose a stamped and addressed padded bag. You should also note that shorter programs are treated more favourably. Be warned though, it may be quite a few months before you see your work in print (if it managed to pass the two or three checking processes). There are various Editorial reasons for this, but mainly because your magazine is normally produced nearly two months before the publication date.

For the benefit of those who have already submitted programs, at the present time the following are sitting in the "possibles" file:

Adventure.Bas	*D. Liebke*
Menu Maker	*A. Trost*
SA Jubilee	*R. Walker*
Alien Invaders	*Messrs Broad/Wise*
Battleship	*Steven Hall*
Reserved RAM	*I. Wallace*
Flash Cards	*P. Doutch*
464 Lotto	*B. Shultz*
Cross Word	*L. Heron*
Pedigree Program	*L. Cherry*
Trigonometry	*P. Muscat*
Math Help	*T. Barberi*
Clock.Bas	*I. Abbott*
Telad Database	*G. Smith*
Home Inventory	*J. Murphy*
Mini W/P	*M. Ogden*
Therapy Adventure	*D. Rich*
Mini W/P	*W. Pynt*
Key Expander	*S. Miles*
Tape/Disc reader	*R. Rayner*
Pengo/Battleships	*R. Kippenberger*
Storybook	*C. Greaves*
Wolfpack etc	*R. Lundquest*
Horoscope etc.	*D. Rich*

I have a rather unusual request for information. I need to know how to wreck the formatting on a formatted disc so as it won't hold any program saved to it or give a catalogue.

I have a beginners' computer class during the week at my school and some are interested in how to work with discs rather than tapes. Obviously I start with how discs are set out and how formatting aids the orderly position of data onto the discs.

As part of the lecture I try to save and ask for a catalogue on an unformatted disc, then I demonstrate the formatting procedure and save and catalogue the disc with success.

Now that all my discs are formatted I cannot show the consequences of using a disc straight out of the plastic which I think is important.

If a beginner can't see what can go wrong then he can't fix a problem when it occurs. Any unformatting advice you can give which doesn't include the corruption of the disc medium would be greatly appreciated.

A. Trost, Gracemere, QLD

When I get the Amstrad User one of the first things I look at is "THE AMSTRAD USER HALL OF FAME.'

I like reading this to see how high people can score on games and then trying to beat them if I have the game. But because of this new column you have put in THE AMSTRAD USER called "CHEAT MODE", this is going to wreck the HALL OF FAME. I don't mind things shown in CHEAT MODE that tell you how to get past a certain place in a game or a map of a game, but things like small programs that allow you to have never-ending lives will wreck the HALL OF FAME. As I am very concerned about this fact I would like to know if you are going to do something about printing those programs that give you never-ending lives.

As I said I don't mind maps of games so if anyone has the map of JET SET WILLY I would like it if it could be printed in one of the next AMSTRAD USERS.

J.McNeill, Sale, VIC

This is a valid point, and to be honest, we think that some of the 'achievements' we were getting even before Cheat Mode were not! Lack of space has prevented us from printing the latest list, and unless everyone plays fair there is a danger of it being removed completely.

I became the happy owner of an Amstrad PCW 8256 about three months ago. I have now progressed in its use to a point where I can write letters to you such as this.

However, I must admit that I have sinned against the first commandment insofar as I have not really mastered all the sections of the manual even now.

I have read it and re-read it but, of course, that is not mastering it. The manual has been laid out in a way that makes it practically impossible, for the newcomer, to grasp the interaction of the fundamentals even after a number of readings.

It seems to me that the erudite writer of the manual set out, playfully, to make the basic logic of the machine and the LocoScript program as inaccessible as the clues in one of those adventure games you write about. The fact is, of course, the logic of neither is clearly stated anywhere in the manual.

It should be stated that I boggle over details that to anybody else are probably crystal clear.

The following are a few of the basic things I do not understand - there are more. The 8256 is possessed of 256K of what? Is that what can be stored in the machine or is that what a disc holds? If it's the machine why do I get funny messages when there are only 179K of memory used? How is it that if Drive A is 'full' as it says it is, Drive M has any capacity at all at that point? Or does it?

I think this type of information could have been given as the first section of the manual. I guess what I need to know is the basic logic of the machine, disc storage, LocoScript and their inter-relationship with one another.

As I see it, using the program when

you get the hang of it is easy, provided you take care, even though you do not understand the basic mysteries. The fact that it is not easy to start with is due solely to the way the manual has been written.

The manual does not, for instance, set out to give a general overview of LocoScript functions and having given you the framework then tell you where to get the relevant detailed data to improve your education.

Instead, with a minor concession about the first twenty minutes you are launched on a seemingly endless string of step by step by step instructions describing individual facilities in such detail, that at the end of the reading your mind is full and you do not remember what you have read or where you read it. A bit like the previous sentence you can't see the wood for the trees. Some of this is turned up-side-down and chewed over again in the CP/M Plus section.

I suppose, truth to tell, that the manual was written with a view to its use as a text book in conjunction with a training course. For some reason the Australian supplier seems to believe that the manual alone will be sufficient. If that is so, then I would have expected that a locally written supplement setting out explanations such as those I have suggested would have been provided with the machine. In the absence of a training course or the supplement proposed above and with the manual so very badly organised for the beginner you can take an inordinate, and I suggest unnecessary, length of time learning to use with modest competence what is obviously a marvellous package.

D.S. Kay, Malvern, VIC

You may well find that a copy of "Mastering the Amstrad PCW 8256/8512" by John Hughes will answer most of your questions. We carried a review on the book last month (Page 44) and, surprise, surprise, you can purchase it through this magazine for $29.50 if you are a subscriber, or $32.25 if not (plus , of course, the postage).

For those who are new to computing and confused by all the strange jargon, the list below should be very helpful:-

Byte	What the Vyper does
Debug	De ting killed wid de Mortein
Array	Unit measurement of sunshine
Binary tree	for binary dogs
Emulate	a flightless non-punctual Australian bird
VDU	Socially diseased female sheep
Remote VDU	West Australian socially diseased sheep
RAM	the U's friend
Data source	Flavours microfiche and microchips
Supasort	Racquel Welch
External sort	Mistress
Exchange sort	End of an affair
Operating system	What you get after eating 1 kg of prunes
Kilobaud	1000 risque stories
Memory	...er,..um...
Program	In favour of metric weights
Macro	Scottish oarsman.
sauce	I. Wallace

(Reproduced from the September issue of the Townsville Amstrad User Group News Letter.)

Bulletin Board at Burwood

Max Elliott has been in the office equipment industry for over 25 years, starting at Olivetti prior to decimalisation selling and programming mechanical accounting machines and ending up the accounting machine manager. He has personally programmed square hole punch paper tape equipment as well as selling the early electronic calculators when they were bigger than the current computers.

Max now runs Viatel Computers in Burwood, Vic., where there is currently in stock over 250 x 8" double sided double density diskettes of public domain software. It would be about 160 megabytes give or take 10 or so. This is not the only Public domain software that they carry, but all of the abovementioned is suitable for the Amstrad 6128. They also carry PC software and can supply many programs including educational. The volumes of software originated from the "C", "CPM", and "SIG/M" User groups in America. A printed catalogue of all volumes is available to look at from their premises in Burwood. Max also stocks Amstrad products as well as offering repairs on all types of personal computers.

The company runs an RBBS and is interested in organising a separate section of their remote Bulletin Board specifically for the Amstrad users should there be enough interest. It is capable of running up to 9 users at the same time, but as each phone line requires an automatic Modem as well as a separate phone line, the costs are quite high, not to mention the back-up support provided by: monitoring uploaded new files for downloading, checking files that have been uploaded in the chance they are copywrite, checking messages for any dirty words, backing up the complete system once a week and the list goes on.

The RBBS is online 24 hours per day and operates at 300/300 bps as well as 1200/1200 bps. The 1200/75 is not supported but this speed is being worked on and will be operational.

The current RBBS is a PC compatible running at 10 Megs and has fitted a 30 Meg voice coil hard disc drive, twin 5" drives. From the 30 megs available 16 megabytes is taken up by the Bulletin Boards operating system. This leaves about 10 megabytes free for downloadable public domain software. An Amstrad BBS would give all Amstrad users with modems the means to communicate to one-another via a comprehensive messaging service. Also provided by the system is a "bulletin" section for any comments when evaluating a specific product. This enables all users of the system the benefit of an opinion or knowledge from an actual user.

The log on phone number is 288-3599 (visitors are welcome), but they do require a registration fee to cover some expenses, as well as a registration form duly signed. This can can be printed from the screen.Apart from being known as Viatel Computers, they also trade under the name ABE Computers . The RBBS comes up as ABE (as opposed to Viatel) as this would be quite confusing if they ran it in competition with Telecom.

The company is situated at 24 Burwood Highway, (near Warrigal Road), Burwood, Victoria 3125 and is open normal times, but usually much later. For further information, you can write to the above address or ring during normal hours (03) 288 2144 or 288 9067.

NEWS RELEASE

LED SIGNS GET LARGER, SMARTER AND TALK!

LED signs have the capability of providing public messages to large Audiences. They have traditionally been used in Financial Institutions, Retail Stores, Process Control, Special Functions, Exhibitions and in various other applications to advertise products and services or alert people to some other event of interest.

Setting up the display has been made very simple, the operator needing only to type the display characters required together with the display special features (scroll, roll etc) into an ASCII keyboard and the display will then proceed to advertise or inform automatically until a change is required.

A new range of signs has been released in Australia capable of displaying 16 to 60 characters plus graphics. Sizes vary from 50 by 11.5cm to 152 by 23cm. Local memory varies from 2-16K. Not only is local set-up available from the conventional keyboard, modem and RS232C models allow remote control of the display from a central control point. This will allow an organization to have as many signs as required at various locations and control them from their central facility. PC users can drive the display from their serial port.

Ex-tax prices range from $483 for a 10 character display sign to $2600 for a 16/60 character double height display sign with serial interface.

A locally manufactured intelligent controller capable of natural human voice reproduction is available to back-up the visual display.

Further information is available from the Agents; Zenology Pty Ltd on (03) 233 5764.

Cheat Mode

Some more Tips, Pokes and Game busting ploys to improve your scores. Don't be shy - send yours in to share with all of us.

POKE METHODS

This is the section where we explain how to input the majority of *Cheat Mode* pokes. There are two different methods - the instructions for each poke tell you which one to use. If you have a 664 or 6128, you'll have to type | tape before using either.

Method 1: Make sure that you've rewound the game tape to the beginning. Now type in the poke listing then type RUN and press the 'Enter' key. (Don't use the key marked 'CTRL' or 'CONTROL', that will stop the poke from working.) Press the PLAY key on the cassette deck, and hit any key on the main keyboard - the space bar will do nicely. The tape should now start to play through in the normal way.

Method 2: For this method, you have to skip the first bit of the game program. To do that, start by rewinding the game tape to the beginning. Now type in the listing. Then type CAT, and press the 'Enter' key. Start the tape by pressing PLAY and hitting a key, and then watch the screen.

After a little while you'll get the message "Found SOMETHING block 1". It doesn't matter what the SOMETHING actually is - this will vary from one game to another. If the instructions with the poke just tell you to skip the first block you should stop the tape here. If the instructions tell you to skip several things, stop the tape when the "Found' message comes up for the last thing you're trying to skip.

Once you've stopped the tape press the ESC key, type RUN, and press the 'Enter' key. Now press PLAY on the tape deck, and hit a key on the keyboard to start the tape running.

POWERPLAY

This poke allows you to examine the prepared question files on the Arcana game. Just type in the listing, rewind the tapes on side 2 and run the listing. Once the compiler has loaded, you can load one of the quiz files provided and examine it.

```
10 MEMORY &91FF 20 LOAD "compiler"
30 POKE &9289, &BF
40 CALL &9200
```

KILLAPEDE

This Method 1 poke gives you an awful lot of lives to blast away those insects.

```
10 MEMORY &2000:MODE 1:BORDER 26
20 INK 0,0:INK 1,26:INK 2,24:INK 3,6,
30 CLS:LOAD"!screen",&C000
40 LOAD"!killdisc.obj"
50 BORDER 1:INK 0,1:INK 1,1: INK 2,1:INK 3,1
60 LOAD"!kill.say",&C000
70 POKE &4A14,0
80 CALL &4963
```

THRUST

This nifty poke is entered using Method 1 and gives you an extra new control over your ship. When in flight you can hit the Ctrl key and it stops the ship dead. It doesn't stop the pod if you're carrying it, but controlling it is much easier once you've stopped.

HEAVY ON THE MAGICK

Some tips for anyone stuck in Gargoyle's animated adventure on how to deal with all those doors.

Doors are opened using keys, gold or a password. If a door has a table near it a key is required; if a table and a double-O sign, gold is needed; if pillars with skulls or wolves' heads, a password has to be found.

Rooms requiring keys have names like room of Pride and room of Claws. These names match star signs found next to the keys. For example Leo the lion matches the room of Pride and Cancer the crab matches the room of Claws.

Elementals are a problem, as they block progress or guard useful objects. To obtain the objects a replacement has to be found. A pellet is replaced by a ball, an egg by a shell, and a nugget by a nougat.

To get past the fire you must carry the salamander clasp. To pass the hydra you must have the snake clasp. Most monsters can be dealt with by blasting but other larger ones require an object to kill them. Use the mirror on Medusa, the pellet on the slug, the slat on the cyclops, the garlic on the vampire and the nugget on the werewolf. If you run into them without the right objects the only way past is to transfuse till you have 99 stamina points and then continually freeze them.

JACK THE NIPPER

We've got both disc and tape pokes for the Gremlin game. Type in the disc poke and save it to a separate disc - not the game disc. Once saved you just need to run it and follow the on-screen instructions. The tape poke is entered using Method 1.

Please note that the disc poke actually writes to your game disc and alters it, so ensure the write-protect tab is off or the poke won't work. There is a check in the program that should stop any errors in the data getting through, but you should be very careful when typing it in.

SAI COMBAT

Dan Rodgers of London has some tips for the combat game that he says should allow you to carry on endlessly.

For white to black-belt opponents you should advance two paces forward and hold a chest kick. When the opponent is near enough, chest-kick repeatedly, never allowing your foot to touch the floor. That should do them all in.

For the black belt and all Dan belts you should somersault twice into the middle of the screen and then repeat the routine with the chest kick. When the throwing stars come along the ground, use a flying kick to avoid them, as you will often injure your opponent as well. When the stars come at head height, duck.

GET DEXTER

If you press the Delete key it will pause the game.

TOBRUK

Here's a method for winning on the PSS war game. It hardly tests your strategic and tactical skills but it works.

1. Move all units with a six-movement allowance and surround Bir Hacheim.
2. Move supplies to within six spaces of units.
3. Keep attacking Bir Hacheim with all units.
4. Every move, try to move supplies around a bit so they won't get hit by an enemy air strike.
5. On command phase use all 30 points on air attacks.
6. When it comes to the air attack always bomb Tobruk.
7. After bombing Tobruk three times it will surrender

NEXOR

A Method 1 poke that gives infinite lives on Design Design's 3D arcade adventure.

STARSTRIKE II

Tips for the Realtime game take you through it stage by stage.

When you start the game you are shown a chart of the systems. If you're a beginner then go for the Beta system, which is relatively easy. Once you've chosen a system, the map of its planets appears. These are split into three types:
Agricultural - These have poor defences and are the easiest of the three. The stages are space gates, fighters, planetary descent and control room.
Industrial - These are slightly harder, consisting of space gates fighters, ventilation duct and control room.
Military - These are the hardest of the three. They are made up of the space wheel, space gates, fighters, planetary descent, ventilation duct and control room.
Note that sometimes an alarm will sound and a load of coloured rectangles will head for you. They can't be shot so you have to dodge them, but fortunately they don't take much off your shield.
Space wheel: Appears on the screen and moves clockwise. Rotate the ship anti-clockwise and blast the pods off the wheel edge. A door opens; centre the cross-hairs on it and press D. Rotate the ship against the spin of the wheel until the door is horizontal and then keep it there. Once inside blast the fighter and two of the triangles on the far wall. The third triangle stops the iris from moving so shoot it when the iris is fully open and fly out.
Defence shields: There are several different gates you have to negotiate. Each one has a diamond-shaped gap containing squares and triangles. The triangles can be shot but the squares cannot. To pass through safely, head for the middle square firing at any missiles that come from the guns. The middle square is set back from the others; when the others disappear from view you can turn to the side very quickly to avoid the final square.
Orbital insertion: To be on the safe side transfer as much fuel to the shield as possible.
Fighters: It's best to turn your engines off to conserve fuel and keep on the windows (press H). Fighters have to be shot three times before they explode and reveal the fuel pod. To get the pod just keep it in sight and thrust hard towards it. Scavengers need only one shot to destroy them. The number of fighters depends on the strength of the planet.
Ground attack: This is the easy bit. All you have to do here is avoid the moving rectangles, missiles and vertical lasers and blast away at everything else. Go at full speed to save fuel.
Ventilation duct: Stay at half speed and just try to dodge everything. Be particularly careful with the irises.
Control rooms: Each planet has either a reactor or a battle computer. Just shoot it and fly out of the door that opens. Otherwise you return to the ground attack or ventilation duct of that planet.
The easiest system is Beta, then Alpha and Delta. Do epsilon last: this is the toughest. When refuelling in the module, fill up only your energy bar or you'll never be able to complete the game.

FOURTH PROTOCOL

Some excellent tips for the first part of this game of intrigue and deception that should enable you to complete it.
On June 8 you receive a memo asking you to install security systems in the CO Data Analyst building, to which you must reply yes. The basement must be locked in the following way: both computer-room doors, the office and the data storage area. On the ground floor you need to lock the main entrance doors, the desk and key room, the office, the security door and the meeting room. If you carry that out correctly you'll get another memo later on which requires you to decide on the order of importance of the following:
1. Computer audits by system analysts.
2. Special password changed weekly.
3. Special keys to secure areas.
4. Phone call through human operators.

Their correct order of importance is 2431, which should stop hackers getting into the system.
Cencom contains the file Telephone which lists three numbers: Blenheim computer 04382731, medical security 71288989, and Sir Anthony Plumb 12377563. The last number should be used when the player knows all the details about the traitor and his contact. Don't dial it if you aren't sure because you will lose valuable prestige points.
Medical security can be called only after Bracton has called you. Bracton seems obsessed with calling you so read his file along with Thorn's. Blenheim's computer can be called at any time; by giving the decoded password you're given at the start you can transfer files to Cencom, where they can be examined.
Among the files you can get from Blenheim are: Nato, paper 1, paper 2, paper 3, paper 4, paper 5, MoD, Cabinet, Foreign, Abbs, Stanistav, pizza, maras, Pastemak, Faulkner, Bracton, Thorn, Blodwyn, trad, names, delivery, Nilson, Omparde, Shoukir and Fox.
By analysis of the files papers 1-5, MoD, Cabinet and Foreign you can narrow the traitor down to one of five men who had access to all the documents and photocopier.
Generally the more watchers you have on a target the faster you get the results. Always answer the phone quickly because some of the calls are very important. Never have watchers on targets that have already been dealt with as it loses prestige points. Some targets such as Warburton and Banister require the full 25 watchers to get results.

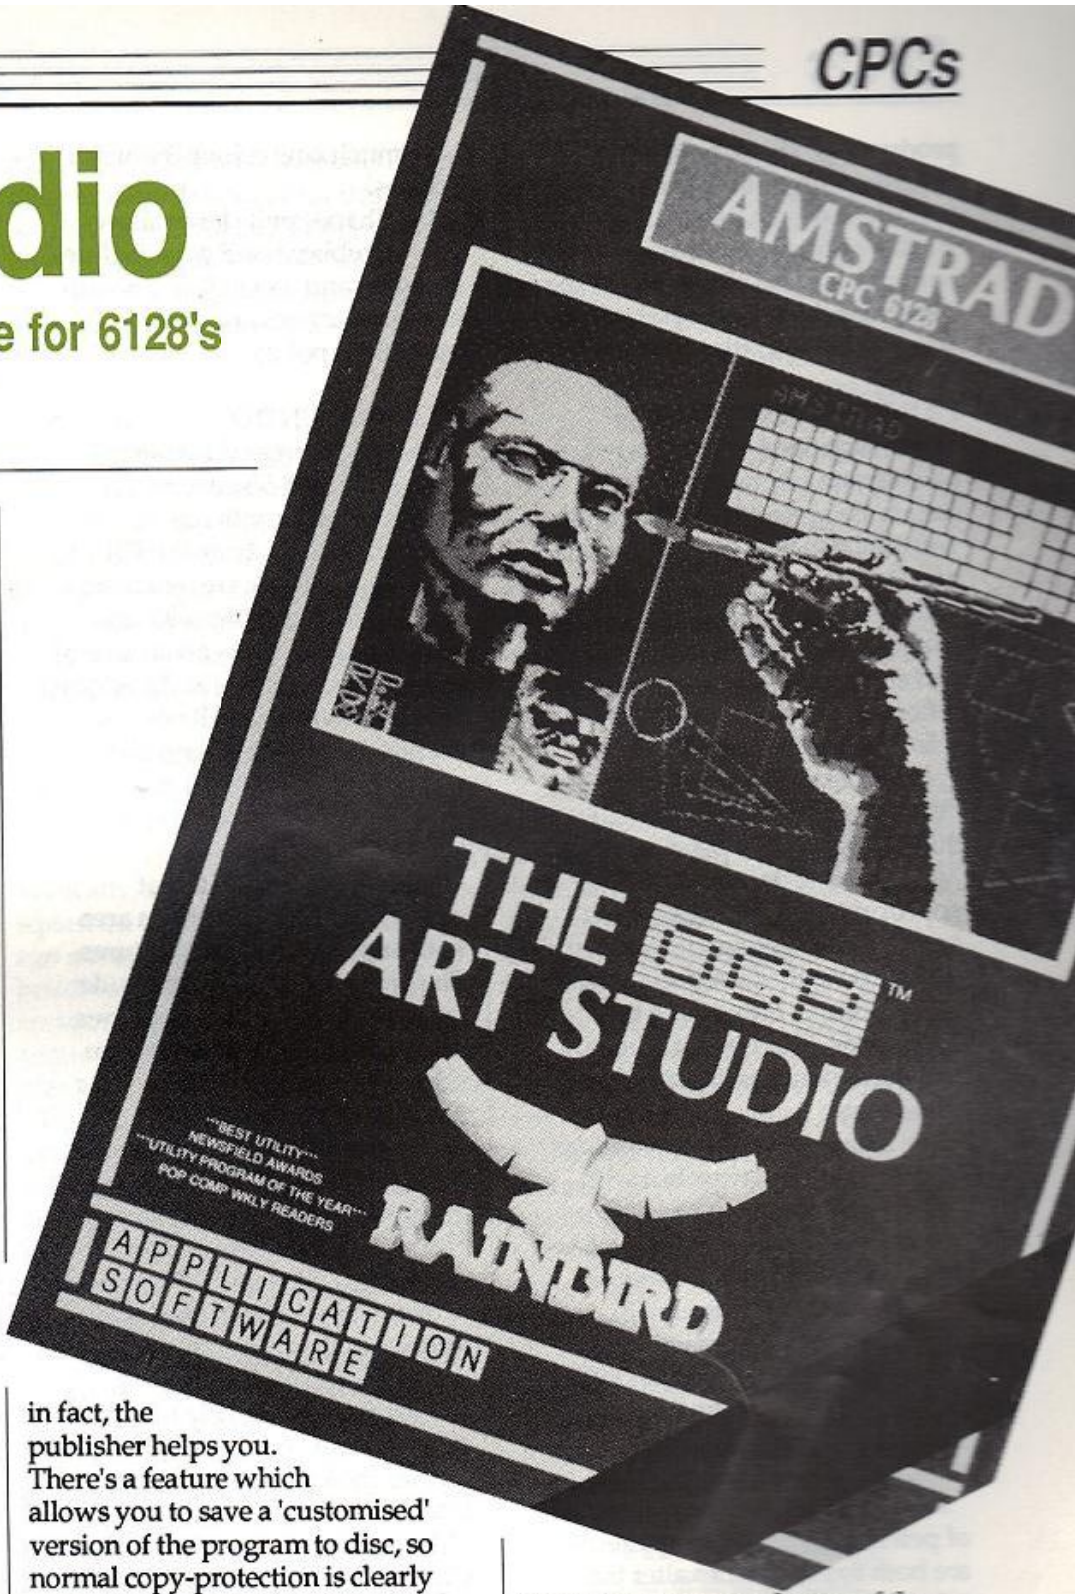
Art Studio

A Review of the package for 6128's only from Rainbird



If you want to buy an art package for your Arnold, you'll find you're spoilt for choice. Under the circumstances any new system needs to be something really special if it's going to survive. Rainbird has just released *ART STUDIO* for the 6128 and special is certainly the word for it.

Two things struck me immediately about the package: first that it works only in Arnold's two-or four-colour modes (modes 1 and 2) rather than the more normal multi-colour mode O, and second that it is strongly inspired by the Apple Macintosh and similar WIMP (Window, Icon, Mouse, Pull-down menu) systems.

How you feel about the first of these is very much a matter of taste - I can't say I miss mode O myself, but it does seem an odd omission. As for Art Studio being WIMP-inspired, that's pretty common these days. The difference here is that where most packages aim to look like the Macintosh, Art Studio sets out to perform like it - and to a considerable extent it succeeds.

PROTECTION

The first thing you'll notice about the system is the Lenslok protection it uses. I've had my rant in the past about honest users being saddled with cumbersome protection systems, and I'd certainly call Lenslok cumbersome - but in this case there is a reason for it.

Rainbird doesn't try to stop you from making copies of Art Studio; in fact, the publisher helps you. There's a feature which allows you to save a 'customised' version of the program to disc, so normal copy-protection is clearly not going to work. Given that the program is easily usable without the manual, Lenslok is the only alternative to actually trusting people.

SELECTING PULL-DOWNS

Once you've got past the protection system to the program itself, you're presented with the usual blank screen. There's a series of options runs across the top of the screen, and a small 'arrow' pointer. You can move the pointer around using cursor keys, joystick, or even a mouse if you're lucky enough to have one.

To select one of the options just move the pointer to it and press 'select'. (That's the space bar on the keyboard or the fire button on the joystick.) Selecting an option

produces a *pull-down-menu* - a list of further options which overlays part of the screen like a roller window blind. Choosing one of the options on a pull-down works the same way: move the pointer to it, press 'select' and there you are.

PAINTING AND SHAPES

The first options you're likely to be interested in are *Paint* and *shapes*. Between them these offer you all the main features you'll need to create your pictures.

The Paint pull-down provides the three main tools - pen, brush and spraycan -in a variety of different shapes and sizes. On selecting pen, for example, you'll get another pull-down panel demonstrating the sixteen different shapes of pen available. Just move the pointer to the appropriate shape, press 'select' and you're in pen mode. Move the pointer onto the drawing area and it turns from a little arrow to a little pencil. Hold 'select' down, move this pencil pointer and you'll draw a line.

The brush and spraycan options work in the same way, but with brush - and spraycan-shaped pointers instead of the little pencil shape. These different-shaped pointers are meant to remind you which drawing or painting mode you're in. and like pull-downs they make the program very easy to learn without the use of the manual.

Although the available ranges of pen shapes and spray patterns are both fixed, you can alter the selection of brushes to suit your needs using the *edit brush* option on the Paint pull-down. Choosing this option gives you a brush-editing menu where you can alter the pattern of dots that forms each brush. This comes in two stages, the *data* and the *mask*. Put simply, the mask defines how much of the background the brush wipes out and the data defines how much new colour the brush applies.

The Shapes pull-down allows you to 'rubber-band' straight lines, triangles and rectangles. You can also draw circles and plot individual points.

FILL AND UNDO

Once you've created a drawing with *Paint* and *Shape* you can flesh it out a bit with the different options from the *Fill* pull-down. There are two main types of fill available: *solid* and *over*. Solid fill works on an area of one colour and stops at the edges of that area. With overfill you outline an area with (say) blue and any colour inside is changed to blue. For most purposes you'll want to use a solid fill.

As well as filling with flat colour, you can solid-fill an area with one of 32 different textures. The predefined textures include grid, fine checks and wavy-lines, but if you can't find the one you want you can define one of your own using *edit texture*.

Over is the riskier proposition, but either kind of fill can 'escape' through the tiniest of gaps. Fortunately there is a way of reversing a fill or any other kind of drawing operation that goes wrong. Of the various options across the top of the screen only one works immediately rather than offering you a pull-down of further choices. That option is *Undo*.

The extra memory on the 6128 allows for certain luxuries, and *Undo* is one of them. Instead of keeping just one copy of your picture in memory the way most art programs do - the copy you're working, that is - *Art STudio* keeps a spare one as well. Every time you switch drawing mode or perform some similar operation, *Art Studio* brings the spare copy up to date. This means that when you're halfway through performing a series of fills or whatever, *Art Studio* still knows what your picture looked like before you started filling. When you select *Undo*, the program restores your working copy to the same state as the spare.

This spare copy of your picture isn't used just for *Undo*. It also makes possible the wash *texture* option on the *fill* pull-down. This remarkable feature takes all the changes you've just made to the picture - all the things that *Undo* would undo - and fills them with texture. This effectively allows you to paint, spray and draw with textures rather than solid colours. While you can't actually see the effect until you've selected *wash texture*, it remains a very powerful technique.

MAGNIFY

Another benefit of the 6128's extra memory is the *Magnify* option. Rather than the small magnification window offered by most packages, Art Studio gives you a full-screen image. You can enlarge a given area of the screen by 2, 4 or 8 times.

Simply select the appropriate enlargement factor from the *Magnify* pull-down, move the cursor (now shaped like a magnifying glass) to the area of your drawing which you want enlarged and press 'select'. The screen now fills with an enormous blown-up section of your picture.

Though there's no normal-size image of the magnified area you're working on, you're unlikely to find this a problem. The large window means that on x2 magnification you can see almost a full quarter of your picture - easily enough to see what you're doing to the picture as a whole. You can switch between the different enlargements without returning to the main menu. On x8 there's an optional grid to make it clearer where one pixel - one individual

dot of colour - ends and the next one begins.

Your free to pan the *Magnify* window across the picture by pointing at and selecting the Macintosh-style 'scroll-bars' along the top and left edges of the window itself. You can make fine adjustments to the picture using any of the available colours, and undo them again it they don't look right. Every possible consideration is given to the keyboard-only user, with sensibly chosen keys to switch colours and pan the window.

TEXT

If there's a central theme to Art Studio it's thoroughness. Text entry, an afterthought in most packages, is given the fullest treatment you could ask for. You can use text in any of three widths and heights, combining them freely to get a wide range of shapes.

Your text can run left to right or top to bottom, and the letters can be upright or sideways. There are also bold and italic options which can produce very useful if rather crude results. If you want to do anything more complex with text, the *font editor* option takes you into a whole new league.

When you select *font editor* you're presented with a whole fresh screen dedicated to lettering styles. The full character set of the current font is displayed on the bottom half of the screen, while at the top there's a detailed view of the character currently being edited. You can scan through the character set, scroll an individual character or the whole font in any direction, make minute alterations to the current character, or clear it and start from scratch.

Several fonts are supplied on the Art Studio disc, and you can save modified versions of these or your own original fonts for later use. If you wanted to create foreign alphabets or scientific symbols for diagrams, you should find this way simple. Of course most people aren't going to bother with all this, but most packages wouldn't give you the option in the first place.

WINDOWS

Once you've created your picture you might well want to make large-scale alterations to it. The *Windows* pull-down offers a strong set of special effects based on the idea of a 'window' - a rectangular area of the screen defined by stretching a 'rubber box' round it.

Windows can be copied, moved or cleared. They can be rotated through 90, 180 or 270 degrees, mirrored horizontally or vertically, and stretched or squashed in either direction. You can use a window like a paint-brush with the 'smear' option, or merge it with the previous contents of the area you're copying it to.

Windowing needn't involve moving an area of the screen around. The *swap* inks and *change* ink options allow you to alter the colours of a windowed area, and are particularly powerful for creating special effects.

Everything possible is done to reduce the effort needed in defining windows. You can define the whole screen as a window simply by selecting *whole screen* from the pull-down, or redefine the previous window using *last window* . If you want to make several copies of the same thing you can set the copying mode to 'multiple'. This means that Art Studio automatically redefines the last window after each operation on it, cutting in half the amount of selection you have to do.

FINISHING TOUCHES

The file-handling and printer-dump options show the thoroughness and ease of use characteristic of the program as a whole. The printer option is particularly well thought out, with just about every feature you could ask for to cope with the quirks of different printers.

The manual is excellent, though you probably won't find you need to refer to it all that often. For most people its chief function will be to point out all the many excellent features which you could otherwise easily miss. The program is so natural and self-explanatory that you can work out most of the main features just by sitting down and using it.

VERDICT

Of all the many art packages available for the Arnold, this has to be the best. The only real shortcomings are the lack of a mode-0 facility and the need for a 128K system; Lenslok is an additional annoyance. These are far outweighed in my book by the enormous power, ease of use and attention to detail which are visible in every aspect of the system.

While Art Studio is easy to operate from the keyboard - you can even define your own keys if you like - or a joystick, plugging in an AMX or Kempston Mouse turns it into an absolute joy. An awful lot of packages use icons and pull-downs just to be fashionable but Art Studio makes them earn their keep.

If you're after an art package that feels natural, gives good results quickly and that you won't outgrow, Art Studio must be the one.

PLUSES - Extremely powerful, handles well with keys, joystick or mouse. First rate manual. UNDO makes for experimentation without tears. Can save customised versions to disc.

MINUSES - No mode 0. 664 owners will need 64k of add-on RAM, and 464 owners will need a disc drive too.

Intelligent Menu

by Chris Collins

This is a very simple and short program for the Amstrad CPC computers, which permits you to CAT a disc, select the program you want and LOAD, RUN or DELETE it with the minimum of typing.

One of the more commonly used methods of providing a menu of programs to select from, is to create a menu program and insert the programs' names into it. This is all very well for a disc on which the contents rarely change but it is a pain otherwise, as you must keep adding program names and resaving it.

This program is in effect 'an intelligent menu' in that it doesn't matter what programs are on the disc. In fact you can load the program and then change the disc if you wish.

There is not much that can be said about the operation of the program as it is all prompted. When presented with the menu in mode 2, use the cursor keys to move the arrow to the program that you wish and press <ENTER>. A message will tell you the program that you have selected and ask you to select from LOAD,RUN,DELETE or Cancel by selecting the appropriate letter.

If you select DELETE, you are warned and asked to confirm with 'Y'. Any other key resets the arrow, for you to select again. Cancel will return you to the same position. Having selected L or R the program will be loaded or run as appropriate.

The program should be typed in and then saved with the title 'DISC'. A copy should be kept on each disc, so that all that is required is to insert the disc and RUN"DISC

There are two versions of the program. One to run on the 664/6128 and a version with a small machine code routine for the 464/DDI because the 464 doesn't have a COPYCHR$ command.

There will be a problem with some basic loader programs in that they will require a 'MODE' command inserted so as to reset the window commands that are used in the program.

HOW IT WORKS

664/6128	464	
20	20	Sets up an error routine and then recommences the program at line 110.
40	40	Sets up windows.
50 - 80	50 - 80	Draws outline.
90	90	CATS then clears windows.
-	100	Jumps to routine.
100 - 230	110 - 240	Position cursor and move cursor around the screen.
240 - 260	250 - 270	Locate cursor and read program name to the screen.
270 - 280	280 - 290	Checks that 9th character is a full stop <.> and if not reports ERROR 200 and then to 330.
290 - 300	300 - 310	Prints program name and asks for selection.
310	320	Checks for DELETE and asks for confirmation.
320	330	Checks for LOAD or RUN and carries out instruction or reruns the program.
-	360 - 410	Machine code routine.

Tape subscribers please note that both versions of the program appear on this month's tape. They are named MENU464 and MENU6128. No prizes for guessing which is which!

Wired for Sound

Part Two of our Music Special

Last month, computer musician Mark Jenkins investigated the musical possibilities of Arnold with an explanation of the development and use of the MIDI. Reviews of Miditrack Performer (EMR), Maestro (Vanguard Leisure), Amdrum (Cheetah) and Music Master (Vanguard Leisure) were provided.
The best is yet to come in this final part.

THE ADVANCED MUSIC SYSTEM
Rainbird: all CPCs (disc only)

The Music System from Rainbird was certainly way ahead of the competition when it was first released some six months ago, and none of the music packages since have really done anything to change this. Not content with merely having the best music product on the market, Rainbird have brought out a new improved version for disk users. They call it *The Advanced Music System*, and I'd say that 'advanced' is the word for it.

Rainbird have added two new modules to the original system: as well as the music editing and playback section, the advanced package has printout and file-linking modules. These beef the system up a great deal, and that's no mean feat considering how thorough it was to start with.

USING THE SYSTEM

You'll notice the extra features as soon as you start using the package. After the loading screen you face a new control screen, with icons meaning link, edit/playback and printout. To start with, the linker is highlighted. You can move the highlight to either of the other modules by hitting the space bar, or select the highlighted module by hitting enter/return. This is the system used throughout the package for selecting icons, so owners of the original system will immediately feel at home.

The first thing you'll want to do is create your piece of music. For this you'll need to select the edit/playback module.

EDITING AND PLAYBACK

The edit/playback screen is dominated by the Voice Monitor Window, or VMW. There are three voices - three separate parts to your harmony - but you can edit only one at a time. You can scroll through the score for each voice, adding and deleting notes as you see fit. The use of a scrolling window makes editing very easy indeed; it is one of the system's strengths that its competitors would do well to emulate.

Editing options include just about every feature a piece of music can have: dynamics, accents, accidentals or whatever. These are all easily accessible from pull-down menus, and there are quicker key combinations you can use once you're more experienced. You can set the system to insert barlines automatically, or you can put them in by hand if you have a taste for irregular time signatures. The only serious omission is triplets, but that's not exactly crippling.

Recording was a unique feature of the original system, and is still something quite unusual these days. In recording mode, part of Arnold's keyboard behaves like a piano. By hitting different keys you can play tunes, either recording them or just practising. Recording a piece of music doesn't just store it for playback - it actually writes your tune onto the stave for subsequent editing or printout.

Once you've written or recorded your tune, you'll want to play it back. Here there is a really nice option: you can set your score to scroll through the VMW, a note at a time, as the system plays it. Unlike in edit mode, all three voices are displayed at once. It's an impressive and entertaining feature, and a great way to track down that elusive wrong note.

What's really nice about the playback system is the way it behaves like normal music. Accidentals affect subsequent notes in the bar, for example, and the first note of each bar is accented. This sort of thing adds to

my impression that the package really can offer something to serious musicians, as well as the enthusiastic amateurs most packages cater for.

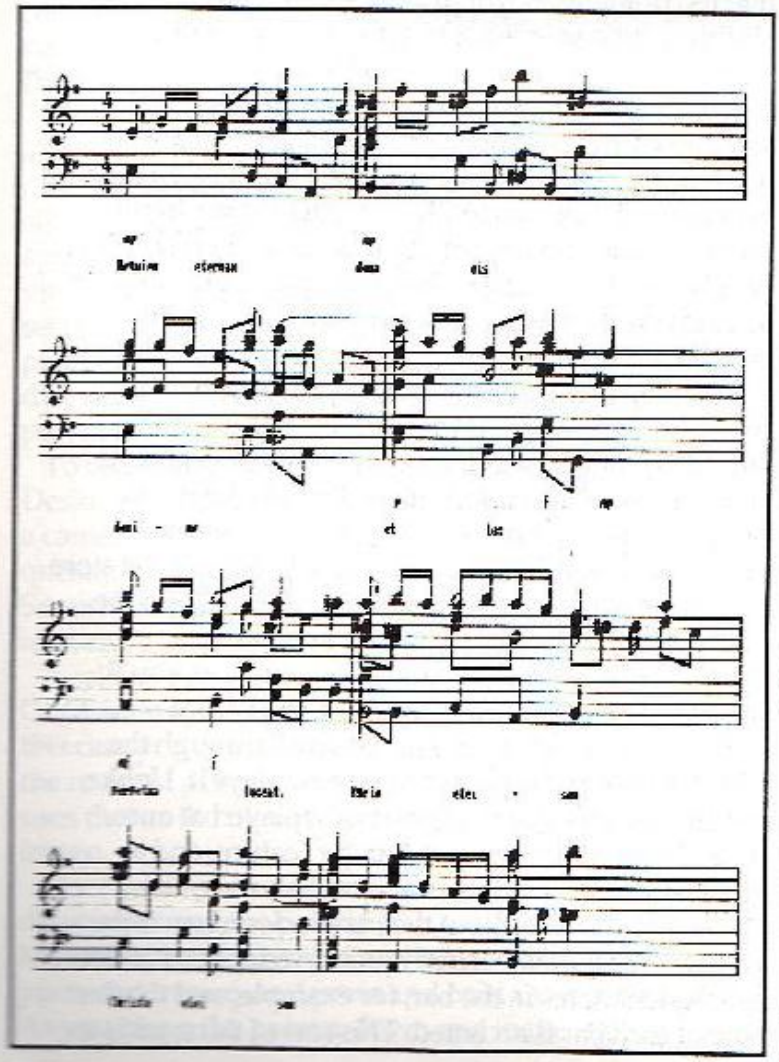
HARD COPY

The separate printout module is well thought out, and will prove invaluable to musicians everywhere. It can print up to six voices on one stave, displaying dynamics and even allowing you to add a line of lyrics or additional directions.

The ability to handle six different voices is very impressive, but it does cause the odd complication. After all, the editor can only handle three voices and music files only contain three voices.

To get a six-voice tune then, you have to edit and play it as two three-voice tunes. You can then switch to the printout module, load the two separate music files you've created and then print all six voices out.

Adding lyrics is very straightforward - just type them in underneath each bar. You can use only one line, though, and some users may find they need to save this for additional, non-*Music System* directions like *legato* or *andante*. The lyrics come out in a small, rather poorly defined typeface but are perfectly readable. It's a shame they couldn't be slightly more legible though - of a quality to match the notes - since the system has obvious uses in music teaching.



The module can drive a wide range of dot-matrix printers, and can cope with continuous or single-shee paper over 80 or 132 columns.

It can split bars at the edge of the page or wrap them onto the next line, cut out individual voices or even clefs, and string separate files together for printing lengthy works.

LINKING

The need for that last printout option stems from the main shortcoming of the original system: the small amount of memory available for your tune. There's room for a maximum of 1000 notes in memory, and th has to be shared between the three separate voices.

To write longer works than this limit would otherwise allow, you have to use the advanced system's new linker module. This allows you to load i up to 13 music files at a time, with an upper limit of over 6000 notes total.

Having loaded the files you can then build them up into a playing sequence - a list of files to be played. You can repeat movements or entire pieces, so that th sequence itself involves many more than 6000 notes. You can have up to 99 separate entries in the sequence and that will be more than enough for most purposes. The whole sequence can be saved to disk, loaded in later and played as a concert or simply as one enormous composition.

VERDICT

The main section of the system looks every bit as good now as it did six months ago. The linker goes some considerable way toward solving its space problems and as such is a welcome feature of the advanced system.

But it's the hard-copy facility that really earns that extra money. The addition of the printer module gives the system a whole range of uses it didn't have open to it before. You can now record a piece on the keyboard, edit it in the VMW and dump it to your printer as a finished score without once having to pick up a pencil.

If you want to arrange a piece for an ensemble and then print each instrument's part separately, the system can do this quite easily.

Choral arrangements would need a little more work to cope with differences in the lyrics of separate parts, but the system would still be an enormous advantage.

The printout module makes the *Advanced Music System* a useful musical tool, as well as the entertaining and easy-to-use program the original system was.

E.M.U. (ELECTRONIC MUSIC UTILITY)
Discovery: all CPCs (cassette or disc)

This Discovery package could be the first to give *The Music System* a run for its money. It isn't just a simple music program by any means - it could come in very handy as a utility for anyone wanting to add music to their own programs. But let's take a look at the editing and playback side of things first.

MAKING MUSIC

EMU is a menu-driven program: to choose an option, you have to move a highlight up and down or from side to side in a list of choices, hitting the enter or return key when you've found the one you want. This is a deliberate departure from the more fashionable icon system, and does avoid those annoying 'guess what this symbol means' problems. I don't think it really makes much difference in the long run, but it does make things a little easier when you're learning to use the system.

Selecting 'Music' from the main menu gives you the main editing screen, with a new sub-menu running across the top of it. Sub-menu options include edit, record and play. 'Edit' gives you direct access to the scores for the different voices. All three of these are visible at once, so it's easy to create decent harmonies without too much voice switching.

This is probably just as well, because there is a slight problem with voice-switching on the EMU: infuriatingly, it returns you to the start of the piece every time you move from one voice to another. This is a shame, because the editing is otherwise very nice indeed. Using the numeric keypad as an extended cursor pad you can rapidly select the pitch and length of note or rest you want, and facilities for deleting and inserting are the best I've yet seen on a music package.

If all that musical notation seems a little daunting, there's a very effective *Music System* -style 'Record' option using the top two rows of the micro's keyboard as your piano. Once you've recorded your music onto the stave, you can bring all that lovely editing power to bear on it - and that's a strong combination.

USING THE MUSIC

When it comes to doing things with the music you've created, EMU may not be able to print the stuff out but it does have another trick up its sleeve. By selecting the option 'Save-RSX' from the tape/disk sub-menu, you can create a 'stand-alone' file. This is a machine-code routine which you can use with your own Basic programs, quite independently of EMU itself.

All you need to do to use such a file is write a simple piece of Basic into your program - about five lines, all told. Run these to set the system up, and you can then use the bar command PLAY to play a particular piece of music. The music will keep going while you do other things , so you could use it quite easily for adding music to Basic games. The only thing it won't play through is a tape load or save, and that's hardly likely to spoil the package for you. It's an easy system to use, and vastly less effort than writing your own music routines. As for space, the demo file of the *Radetsky March* took up 6K - not bad for a substantial piece of music plus the system to play it.

VERDICT

As a straight music-composing program, EMU would come second only to *The Music System* for performance and value for money. It lacks the scrolling display and overall simplicity of Rainbird's offering, but you can see all three voices at once and there's that slick insertion and deletion too.

Of course, EMU isn't just a composing program. It's also a great way to add music to your own Basic programs, and that's something *The Music System* can't do for you. If you're a musician you might well prefer TMS, but if you're a bit of a programmer then EMU's got to be well worth a look.

THE LIGHTHOUSE

A Text Adventure Game - Part One

by Philip Riley

For longer than anyone can remember the old lighthouse has stood on the Island of Lost Souls just off the coast of Southern England. But everyone knows its grim history.

Five keepers of the lighthouse have committed suicide, four have gone mad, four have disappeared without a trace, and two have never reached the lighthouse at all. They vanished forever in the labyrinth of caves which provide the only route into the lighthouse.

You are offered the job as the new keeper of the lighthouse. With some second thoughts you accept and the villagers organise a boat to take you across to the island. It is a cold autumn morning when two of the men from the village row you out through the thick mist that envelopes everything. Suddenly sheer cliffs, hundreds of feet high loom above you. The oarsmen guide the boat towards a small sandy beach which is completely surrounded by the cliffs. As you step ashore one of the men hands you a lantern. The light it gives off is pretty feeble but it is better than nothing.

As the men row away from the island one of them shouts - "Be careful, they say the island is haunted".

You look around at the bleak surrounding and wonder just what you have got yourself into. You contemplate your task before you set off. It won't be easy to reach the summit of the island and light the lamp that is on the top floor of the lighthouse. But someone must do it and you are now the only person on the island, the only person alive that is! It is now that your adventure begins.

The game understands the standard two word commands e.g. 'GET LANTERN', 'FILL LANTERN' etc. Use the cursor keys to move North, South, East or West. To move up or down type in 'UP' or 'DOWN'. You can shorten the two word commands to the first three letters e.g. 'GET LAN', "FIL LAN'. For a list of items that you are carrying type 'IN'. For a description of your present location type in 'LO'. If you think you are stuck with no means of escape, you can quit by typing in 'QU'. Good luck and don't worry if you don't make it first time.

CP/M Revisited

A Primer for Beginners - Part Three

from Fred Robertson-Mudie

Consider now the naming of files and programs. They can be called virtually any name desired, provided some basic rules are adhered to, i.e. the first part of the file name is no more than eight letters and numbers, and the second part, or extension, is no more than three letters or numbers. There are certain characters which cannot be used, though these are detailed in the manual. The standard way of referring to an example filename is to denote it as FILENAME.EXT though this is sometimes abbreviated to FN.FT. In addition, there are certain conventions, in regard to the extensions, used for naming files and programs, and following these conventions can be useful when looking at a file on disc to see exactly what type it is. The more common extension conventions are as follows:-

File Extension	Type of file or program
.COM	CPM command or executable file
.BIN	Binary File
.BAS	Basic File
.TXT	Text or document file
.DOC	Text or document file
.BAK	Back-up file (of any kind)
.ASM	Assembly listing file
.HEX	Intel hexadecimal file
.LBR	Library file
.BQS	Squeezed file

Further details of some of these file types will be dealt with later in this series.

In relation to the CPM programs to be covered in this series of articles, it is not intended to cover the standard ones which are supplied on the Amstrad disc, with a few exceptions, but will cover primarily the Public Domain programs which are available in many User Group Libraries.

Moving now to the various programs to be discussed, these are known as Transient Programs. These programs, like Basic programs are loaded into the Transit Program Area (TPA) of the machine and are dumped when another program is loaded in. There are CPM resident System Extension (RSX) programs, but they will be dealt with later in the series.

The first transient program to be dealt with is one called CAT.COM. This is more usually known as DR.COM, but I have renamed it for my own convenience as its function is so similar to the CAT command in Amstrad Basic and it can be force of habit to type CAT rather than DIR when using CPM. The program is useful in that it not only gives a full Basic style display of programs on a disc, including their size, but details the number directory entries used and left and the amount of disc space used and left. There is a slightly better, and clearer version on the latest Library** disc which I have called CAT3.COM. This version takes 1K less disc space and can be used for both CPM 2.2 and CPM Plus. It can, of course, be renamed CAT.COM (or whatever you like) when placed on your disc.

It should be noted that a running check on the number of directory entries used on a disc can be very useful if you have a disc with lots of fairly small programs on it, as CPM 2.2 and CPM Plus only allow a maximum of 64 directory entries per disc. What would happen if you tried to exceed that number of directory entries is open to speculation, but there is a good chance that something would disappear into the void.

The next program to consider is PIP.COM which is probably one of the more commonly used CPM programs. Whilst the use of PIP is often confined to transferring programs from one disc drive to another, it is not often appreciated that it has a number of other useful functions. It can, for example, transfer a program from one drive to another whilst, at the same time, changing the name of the program. This is done in the following way:

```
A>PIP B:NEWNAME.TXT=
A:OLDNAME.TXT
```

It can, of course, be used to duplicate a program on the same disc with a different name in the following manner:-

```
A>PIP NEWNAME.TXT=
OLDNAME.TXT
```

PIP can also be used to concatenate, i.e. merge, two or more files. This is done as follows:-

```
A>PIP BIGFILE.ONE=
SMALFILE.ONE,SMALFILE.TWO
```

PIP has a number of other uses including sending data to and receiving data from the RS232 port (used for transferring files between machines without having to use Modems and phone lines), as well as having approximately nineteen optional parameters, including verification, echoing to the console, translating to upper or lower case etc. etc. The full details of the uses of the program and its optional parameters are too numerous to mention here, but they can be found in various texts including the two mentioned in part 1 of this series.

** Fred is referring to the Canberra Amstrad User Group Library disc.

INFOCOM ADVENTURES

A Review

by Michael Shepherd

Infocom adventures, the cause of much heartache and pain to many Commodore 64 and other computer owners, are now available for the Amstrad - from the CPC464 to the PCWs. In fact a major point of discussion among computer owners are hints and clues to these adventures, now we can join in this debate.

Infocom are an American based company, originating in the late Seventies from the Massachusetts Institute of Technology.

They got started by seeing the original mainframe adventure game by Woods and Crowther 'Adventure' and deciding they could improve on that. This was the start of their most famous game ZORK; which was released for home computers as ZORKS 1, 2 and 3. They have written many more games since then, averaging one or two titles per year.

One of the outstanding features of all Infocom adventures is that they have a parser that is second to none. (The parser is that bit of the program that tries to make sense of your input and pulls the right data for the reply from the memory.) Slowly other software houses are catching up to this standard eg. Level 9, but not many adventures understand the input "Drop all except the purple handkerchief and give the hanky to the Grue with the head cold" Infocom's do!

One very nice thing about the conversion of the adventures to the Amstrad is that Infocom have released practically all their line in one hit rather than in a trickle. I have seen available on the Amstrad ZORK 1, WITNESS, SEA STALKER, SORCERER, THE HITCHHIKERS GUIDE TO THE GALAXY, ENCHANTER and others. They have four levels of adventure ranging from introductory to expert with standard being the main category. Their story-lines range from Fantasy, Science Fiction, Mystery and Action, so there is something to suit every taste.

However as their programs are so large, they are only available on disc as the replies are read from the disc all the time. (So you have to leave the disc in the machine while playing.) If your machine runs CPM+ you can run the program immediately. With CPM 2.2 you first have to follow the instructions enclosed so you can go into CPM and run the program with the ICPM command then 'filename' when CPM has been booted. I have a 464 and have had no problems with the adventures.

HITCH HIKERS GUIDE TO THE GALAXY

I own this adventure game so I'll finish with a review of it.

The game is based on the zany Sci-Fi book of the same name. In fact the author of the book, Douglas Adams, co-wrote this adventure. You play Arthur Dent, having just woken to one of the worst days of his life, and on his way to the legendary planet of Magrathea. (He doesn't know that just yet.) On his way there he encounters Vogon poetry, Babel fish and Tea. The puzzles are mindwrenching at times; the first being how to avoid being killed by a flying brick when his home is demolished.

The storyline is excellent and very funny, try to input a command when you've been killed by the brick; and watch for the "thing your Aunt gave you but you can't work out what it is" in your inventory. The adventure quickly diverges from the book's plot which can only offer some vague clues to the first few puzzles; especially when in the spaceship 'Heart of Gold' at last all the other characters go off to the sauna leaving you to your own devices.

This is an excellent and at times fiendishly difficult adventure. This or one other of the Infocom adventures is a "must buy" for your collection. It, like all of Infocom's products, is well presented and documented with a large manual and comes with a few extras like your very own fluff, a pre-packaged microscopic space fleet, and no tea. But the price of $50 to $60 could deter some people from buying more than one Infocom adventure.

PERSONALITY TESTER

A 'not too serious' check on how you fit in with others around you

from Edward Leach

The original version of this program first appeared in the October 1984 issue of the English 'Practical Computing' magazine. It was written on a Research Machines 380Z (what ever that is) and required 36K of RAM. This Amstrad version requires about 14k.

Many changes had to be made to enable it to run on the Amstrad (graphics etc.), but of course, the important score marking arrays have been retained with the same values.

There are some 60 questions to answer with a simple Y or N. The answers fall into three categories - the first two being used for analysis purposes which produces both a textual and graph result - the third (L) determines the number of dishonest answers.

What makes LOCOMOTIVE run?

A second look by Petr Lukes

In the April 1986 issue we had a look at the way the editor stores BASIC statements, in a form suitable for execution by the interpreter. With the extension of the program we can now look at the storage of simple variables, both within the program lines and in a table immediately following the program area.

The operating system uses certain locations in the memory to store pointers to the start of the program and the start of the storage of variables. The addresses which initialise the variables prog, scalar, and array, apply to version 1.0. Later versions may use different locations, and while I expect that MALLARD will use a very similar form of storage, the pointers will be in a very different place. Perhaps an owner of a 6128 and a PCW will investigate and advise.

This time we will have a look at scalars, that is single-valued variables; arrays, which are a collection of values referenced by a single name, will be covered later.

Run the program at the end of this article and stop when line 30 is displayed.
Line 20 will appear as hex bytes 0d 00 00 6e 61 6d e5 ef . . . . . .
Line 30 as 0d 08 00 6e 61 6d e5 ef . .

Line 20 was not executed, and it shows how the editor stores the variable in the line; in line 30 the interpreter has established storage for the value, and saved its offset into the variable table.

To generalise, the reference to a variable in the BASIC line is stored in the format t1 o1 oh n a m e + 128 ef , where tl is the type of the variable, o1 and oh are the offset into the table in the lsb, msb format (i.e. offset=o1+oh*256), name is stored as entered except that the last character has bit 7 set (i.e. 128d added to it); ef is the token for the equal sign, which in this case means "store the following value in the memory referenced by name".

First the t1 byte: edit line 20 to name!=1, and the byte will appear as 04. Both 04 and 0d indicate that the variable is real, the only difference being the explicit declaration in 20 as opposed to the default declaration in line 30. Now add line 5 DEFINT n , and edit line 20 to name%=1 . The type bytes will now appear as 02 and 0b. If we change line 5 to DEFSTR n , change line 20 to name$="1" . and line 30 to name="1" the type bytes will be 03 and oc respectively.

In all these cases the offset into the table will remain the same, because the length of the variable name is the same.

We can now proceed to the dump of the scalars and see how the variable is stored in the table. With name still defined as string, the dump shows it stored as: N A M E+128 TT 11 al ah . Name is converted to upper case, with 128 added to the last character. For strings, the type byte tt is 02 (as opposed to 03/0c in the line). The length is given by 11 , 01 in our case. The address, given by al+ah*256(=019Fh), points to the first character of the string.

To show integers, change line 5 back to DEFINT n , and in line 30 enter name=&abcd . In the table, type will be 01 (as opposed to 02/0b in the line), and the value (&abcd) will be stored as CD AB, in the same order as in the line.

Now we go back to reals. Delete line 5, and change line 30 to name=.1 The table type byte will be 04, and the value both in the line and in the table will be stored in five bytes. Storage of real numbers is a subject too complicated to cover here.

So far we used unsigned numeric values, implicitly positive. Negative numbers will have the minus sign stored as f5 in the line (plus sign is indicated by f4). The real storage uses one bit to indicate a negative value, while a negative integer is stored as 65536+value: -1 will be stored as 65535=FFFFh.

The treatment of DEFined FUNctions can be discovered by a similar process.

This exercise can be used to deduce some rules for saving memory. Firstly, use integer variables rather than reals, where possible (i.e. if the values fit in the range -32768 to +32767): each one saves three bytes in the store.

Adventure programs generally have large amounts of text stored as DATA and read into one or more arrays. This means that each string uses up memory in the program area and again in the string store. A better solution would be to read the text into one array as needed, say room by room, although this can lead to delays due to "garbage collection", clearing out of abandoned strings. The delays can be minimized by deliberately invoking the garbage collection by PRINT FRE("")while waiting for a response.

An alternative would be to initialise each array element in the program lines, e.g. r$(0)="Introduction. . . . . ". The garbage collection problem would be avoided, but there is the overhead of extra typing and the extra bytes in each line to reference the array element and enclosing the string.

The next instalment will look at the storage of arrays and some odd bits and pieces.

ADVENTURER'S ATTIC

by Philip Riley

As promised , I now provide the encode decode utility program. (You'll need to read the article on Page 61 of the December '86 issue to understand what is going on!). But before I start with a description of the program there is one point that you must remember - you must map out your adventure using the same style that I explained in the July '86 issue (and that's on Page 24).

Now onto the program, and first, the commands that are available to you when you run the program. The first thing you will be presented with is the question **"How many locations?"**. In the case of the map in the July edition the answer to this would be 9. You are also told to type 0 if you have already defined the locations. Ignore this for the time being. To get the feel of the program don't worry about mapping out a full adventure and typing it in, just type in any number and type in a few sentences.

When you have got past the first question you will be in the main loop. Here, you have several options to choose from. We will work our way through them one at a time.

You will notice the words **LOCATION NUMBER 1** at the top of the screen. Now press the 'down cursor' key and the words **LOCATION NUMBER 2** will replace the previous message. You can in fact move up and down the locations using the up and down cursor keys. You can also move up and down in groups of ten by pressing the left and right cursor keys. One point to note is that the program will not let you go below description 1 or above the maximum amount of descriptions that you defined at the beginning of the program.

Now that you can move up and down the (currently blank) location descriptions you will want to be able to type in your descriptions. Go back to LOCATION NUMBER 1 andtype **C** and you will be presented with the words **INPUT SENTENCE**. So away you go and type in your description. Make sure that the input is no longer than about 250 characters or you will get a string length error. We will look at inputting longer strings next. When you are happy with your description press ENTER and the program will do the rest. (Just what the program does do will be looked at later.) You will now be presented with the words **LOCATION NUMBER 2**, and if you go back to location 1 the program will print your description for you. If you are not happy with the description type **C** and start all over again. (If you hadn't already guessed it **'C'** stands for **change** and it clears the coded string before you type in your description.)

The next command that we will look at is the ADD command. Type **A** and you will be asked to **INPUT SENTENCE** as before but this time the coded string will not be cleared and it will add the input onto the end of the location description that you happen to be on at the time.

Now type in M. This is the memory check. It will give you two figures on the screen. The first is how much memory you have used. The program will then do a garbage collection and print another figure, this is the true amount of memory that you have remaining.

Typing in **S** will save the data to tape or disc and typing in L will load data in from tape or disc. The program does not allow you to choose your own name for the file to be saved or loaded, but you can put your own name into the save routines by editing lines 380 and 400.

One other point to note is that it is best to check the memory using the 'M' command at regular intervals. The program uses a lot of strings that can rapidly use up your free memory. If you run out of memory the computer will lock up on you and you will lose your data.

If at any time when in the main loop you hear a beep, do not worry, it is just the program telling you that you have typed in something wrong.

Now for a breakdown of the program itself:

Line 10	Initial set up of colours and DIMension array.
Lines 20-180	Secondary loop that checks through data and builds up dictionary.
Line 190	Input of required locations.
Lines 200-340	Main loop that checks for your command inputs.
Lines 350-370	Decoding routine
Lines 380-390	Save to tape or disc.
Lines 400-410	Load from tape or disc.
Line 420	Garbage collection and memory check

But what does it all do?

The main loop is pretty simple and won't really need any explanation. The Secondary loop is the most complex part of the program and is really the only part that needs explaining. It is to this part of the program that the computer jumps after you have typed in your location description.

The computer will make either one or two passes through the secondary loop depending on if the word is already in the dictionary or not. At this point I think it would be best if I explained how the dictionary works. First of all type in the following line:

FOR t=45 TO 55:PRINT lo$(t):NEXT <ENTER>

You should now be presented with a list of words all of which have been sorted into various strings depending on their length. At the beginning of each string is a number. This is the length of the individual words in the string. You may notice that the number is one higher than the length of the words, this is because the word also includes the space at the beginning. This group of words is the dictionary that the program has built up from your descriptions. Now type in the following.

FOR t=1 to 10:PRINT d$(t):NEXT <ENTER>

You will now have a lot of gobbledy gook printed on the screen. Believe it or not, the junk that is now on the screen is your location descriptions. This is what they look like in the encoded form. Each word in the description has been broken down into two ASCII characters. The first character is the string that the word is stored in and the second character is the position in that string that the word starts at.

Now for a close look at the secondary loop.

Line 20 asks for your input. After you have pressed <ENTER> lines 30 and 40 checks through your input for any

commas (,) and quotation marks ("). If any are found it changes them to other characters. The reason for this has already been explained in last month's column, so I will not explain it again. The program does not change these characters back again but it is a simple job to use the same routine in reverse to check through the dictionary and change them all back to normal.

Lines 50 to 60 check through your input until it has found one complete word (it finds words by looking for spaces). When a word has been found it moves onto lines 70 and 80 where it checks the numbers at the beginning of the dictionary strings (lo$(n)) until it finds one that matches the length of the string. It then checks through the string for a match to the word and if none is found continues on through the strings until it either finds a match, or runs out of used strings.

If a match is found the program will then jump to lines 160 to 180 where it starts to build up your encoded string. The program then returns to lines 50 and 60 where the next word is sorted. If no match is found for a particular word the computer will again search through the dictionary strings until it finds either a string containing words of the same length that still has room for more words, or until it finds an empty string, in which case it will start a new string for words of that length. It will then move onto lines 160 and 180 and add on the code for the word that it has just inserted.

The decoding routine is on lines 350 to 370 and it is this routine that you must put into your own program to decode your strings. This small routine merely moves along a coded string (d$(n)) two characters at a time and picks out the correct words and prints them onto the screen.

If you break out of the program do not rerun the program or you will lose all of your data. Type in GOTO 190 and ENTER and this will put you back into the main loop. This is one of the reasons that I put the zero into the first question, after running the program it allows you to skip a DIM statement and prevents an error from occurring. Type in 0 at the question on line 190 when jumping into the program.

Another point to remember is that the larger the dictionary becomes, the longer it takes to sort the words and insert them into the dictionary. Also if you wish to load your data into your own game use the loading routine on lines 400 and 410.

Using this system you should be able to write a 200 room adventure with fairly short descriptions or a 150 room adventure with fairly lengthy descriptions.

On closing, I would like to thank Geoff White, who provided me with the original listing that I have adapted into this utility.
