# 1 Introduction

---

## 1.1 Purpose

This document is intended for IBM Service and Support for the following IBM products:

- Zeus x366
- Hermes x460 /MXE-460
- Maia x260

Since the BMC code base is common for all of these products, a single document applies. In this document, these products are collectively known as 'Zeus'.

This document specifically deals with situations in which it is required that the BMC IPMI log is the only available source of machine log information. Since this log is designed to the industry standard IPMI specification, it is not formatted in a way that yields explicit service information. This document provides limited translation capabilities for trained service personnel.

When to use BMC logs:

- When a Service Processor is not present in the system, or the Service Processor has failed.
- When internal Lightpath LEDs are not readily accessible
- More Lightpath information may be needed; for example in the following cases:

NMI	LED lit
PCI BRD	LED lit
CPU BRD	LED lit
I/O BRD	LED lit

- The system is hung.
- The first part replaced did not fix the problem.

---

## 1.2 Viewing BMC logs

There are currently three different methods for BMC System Event Log (SEL) retrieval; BIOS SETUP/CONFIGURATION, DSA and SMBridge. This is important because each of these retrieval methods displays the SEL in a different format. Another very important point is that the majority of data in the SEL is of an informational nature and not useful for problem determination. Once an error entry is identified, this document will provide a look up for a suggested service action plan. This table lookup will be similar to looking up a POST error code in the Hardware Maintenance Manual (HMM) or Problem Determination Guide.

---

## 1.3 BIOS SETUP/CONFIGURATION VIEW

Let's look at a single SEL entry using the BIOS SETUP/CONFIGURATION view as shown below. This view can be accessed under SETUP/ ADVANCED SETUP / BMC SETTINGS / BMC SYSTEM EVENT LOG.

Three key fields are: **Entry Number**, **Entry Details** and **Sensor Number**.

- 38h - 4Fh
- 70h - 80h
- 90h - 9Bh
- ABh
- B0h - B5h
- B7h
- C5h - CFh

In comparing the ranges, we see that A8h is not listed in the range of errors, so we can classify this entry as informational. Had this been an error entry we could have looked up the suggested service action by using the Sensor Number A8h as the error code.

## 1.4 SMBridge View

So far our classification algorithm for each entry has been:

- 1) Look at the Entry Details field and go to the final step, (step 2) if no keyword is found.
- 2) Compare the Sensor Number with known Sensor Number error ranges.

This same algorithm will now be applied to the SMBridge view. In looking at Figure 2-2, we see that the SMBridge view has very similar information to the BIOS SETUT/CONFIGURATION view. Our key fields, Entry Number, Entry Details, and Sensor Number are still shown but this time they are in a more tabular form. Since the key fields are the same, the only real difference has to do with the sensor number which is displayed as an integer value preceded by a # sign. Therefore to make our classification algorithm work, we need only to look up the error sensor number in integer range table.

The integer sensor number error ranges are as shown:

- 21 - 45
- 56 - 79
- 112 - 128
- 114 - 155
- 171
- 176 - 181
- 183
- 197 - 207

Entry Number	Timestamp	Sensor Number	Entry Details	Entry Details (continued)
1=	2005/02/02 16:46:42,	#182	OEM Reserved,	Upper Non-critical - going high (deassertion event)
2=	2005/02/02 16:46:42,	#182	OEM Reserved,	Upper Critical - going high (deassertion event)
3=	2005/02/02 16:47:40,	#168	Power Unit,	OEM
4=	1970/01/01 00:00:04,	#38	Power Supply,	Presence detected
5=	1970/01/01 00:00:04,	#39	Power Supply,	Presence detected
6=	1970/01/01 00:00:04,	#144	Processor,	Processor Presence detected
10=	1970/01/01 00:00:08,	#80	Fan,	Device Inserted/Device Present
11=	1970/01/01 00:00:08,	#82	Fan,	Device Inserted/Device Present
12=	1970/01/01 00:00:08,	#84	Fan,	Device Inserted/Device Present
13=	1970/01/01 00:00:08,	#86	Fan,	Device Inserted/Device Present

14=	1970/01/01 00:00:09,	#131	Cable,	Device Inserted/Device Present

20=	1970/01/01 00:00:10,	#173	Cable,	Device Inserted/Device Present
21=	1970/01/01 00:00:10,	#205	Cable,	State Deasserted
22=	1970/01/01 00:00:11,	#112	Power Supply,	Presence detected
23=	1970/01/01 00:00:12,	#81	Fan,	Device Inserted/Device Present
24=	1970/01/01 00:00:12,	#83	Fan,	Device Inserted/Device Present
25=	1970/01/01 00:00:12,	#85	Fan,	Device Inserted/Device Present
26=	1970/01/01 00:00:12,	#87	Fan,	Device Inserted/Device Present
27=	1970/01/01 00:00:13,	#140	Add-in Card,	Device Removed/Device Absent
28=	1970/01/01 00:00:13,	#132	Cable,	Device Inserted/Device Present
29=	1970/01/01 00:00:13,	#133	Cable,	Device Inserted/Device Present
30=	1970/01/01 00:00:14,	#160	Add-in Card,	Device Inserted/Device Present
31=	1970/01/01 00:00:14,	#162	Add-in Card,	Device Removed/Device Absent
32=	1970/01/01 00:00:14,	#168	Power Unit,	OEM
33=	1970/01/01 00:00:15,	#169	Power Unit,	OEM
34=	1970/01/01 00:00:15,	#174	Cable,	Device Inserted/Device Present

Figure 1-2, SEL, SMBridge View

## 1.5 DSA View

From figure 2-3, you will notice that the DSA view is slightly different. In an effort to make the log more readable, the Sensor Number has actually been looked up and translated into Sensor Information. If the Sensor Type and Message column look familiar, it's because these columns contain the same information as the Entry Details field. So from our classification algorithm perspective, the Step 1 keyword search will remain unchanged. If no keyword is found, use the Sensor Information to look up the classification and suggested service action.

Dynamic System Analysis		eServer	
IPMI Event			
Time Stamp	SensorType	SensorInformation	Message
02/13/2005 16:06:31	Power Unit	On/Off Cause	
02/13/2005 16:06:33	Power Unit	Sys pwr monitor	Power Off / Power Down.

## 1.6 Differences Between x366, x460, x260

This document is common for all listed machine types because they are based on a common design and code base. However, there are differences noted below.

Depending on the product Zeus (x366), Maia (X260), or Hermes (x460), some sensors will be available while others are unavailable. These sensors, differentiated as such, are specified in the following table.

**Table 1-1: Zeus, Maia, and Hermes Unavailable Sensors**

Sensor Name	Sensor Number	Zeus	Maia	Hermes
Fuel Gauge, Rack, 1 PS, 110VAC	15h		✓	
Fuel Gauge, Rack, 1 PS, 220VAC	16h		✓	
Fuel Gauge, Rack, 2 PS, both 110VAC	17h		✓	
Fuel Gauge, Rack, 2 PS, both 220VAC	18h		✓	
Fuel Gauge, Rack, 2 PS, 1-110VAC and 1-220VAC	19h		✓	
Fuel Gauge, Tower, 1 PS	1Ah	✓		✓
Fuel Gauge, Tower, 2 PS	1Bh	✓		✓
Fuel Gauge, Tower, 3 PS	1Ch	✓		✓
Fuel Gauge, Tower, 4 PS	1Dh	✓		✓
Rack Not Redundant	1Eh		✓	
Tower Not Redundant	1Fh	✓		✓
Rack 12V Faults	2Ch		✓	
Tower 12V Faults	2Dh	✓		✓
Rack Power Supply 1 Fault	38h		✓	
Rack Power Supply 2 Fault	39h		✓	
Tower Power Supply 1 Fault	3Ah	✓		✓
Tower Power Supply 2 Fault	3Bh	✓		✓
Tower Power Supply 3 Fault	3Ch	✓		✓
Tower Power Supply 4 Fault	3Dh	✓		✓
PS 4 Slot Filler Fan Fault	4Fh	✓		✓
Rack DASD 0 Detect	5Eh		✓	
Rack DASD 1 Detect	5Fh		✓	
Rack DASD 2 Detect	60h		✓	
Rack DASD 3 Detect	61h		✓	
Rack DASD 4 Detect	62h		✓	
Rack DASD 5 Detect	63h		✓

Tower DASD 5 Detect	69h	✓		✓
Tower DASD 6 Detect	6Ah	✓		✓
Tower DASD 7 Detect	6Bh	✓		✓
Tower DASD 8 Detect	6Ch	✓		✓
Tower DASD 9 Detect	6Dh	✓		✓
Tower DASD 10 Detect	6Eh	✓		✓
Tower DASD 11 Detect	6Fh	✓		✓
Rack PS 1 Status	70h		✓	
Rack PS 2 Status	71h		✓	
PS 3 Status	72h	✓		✓
PS 4 Status	79h	✓		✓
Tower PS 1 Status	7Ah	✓		✓
Tower PS 2 Status	7Bh	✓		✓

**Zeus\_BMC\_Log\_Spec**

Owner: C. Gillians  
Dept: xSeries Development  
Last Revision: 05/20/05 10:38 AM

Sensor Name	Sensor Number	Zeus	Maia	Hermes
Tower SAS Backplane 1 Detect	A6h	✓		✓
Tower SAS Backplane 2 Detect	A7h	✓		✓
Ping Received	AAh	✓	✓	
Rack SAS Backplane Detect	ADh		✓	
Rack SAS Backplane Incorrect Configuration	CDh		✓	
Tower SAS Backplane Incorrect Configuration	CEh	✓		✓

In addition, only one Fuel Gauge sensor will be active at any time depending on the conditions of the installed and operational power supplies.

## 2 Core Sensor Table

Core sensors from BMC are shown below.

Table 2-1: BMC Core Sensors

Sensor Name	No.	Sensor Type	Reading Type	Logged Assertions	Logged De-Assertions	Event or Error	Repair Actions
Power Unit Status	01h	09h	6Fh	0x00 – Power Off 0x04 – AC Lost	0x00 – Power Off	info	
BMC Watchdog	03h	23h	6Fh	0x00 – Timer Expired, status only 0x01 – Hard Reset 0x02 – Power Down 0x03 – Power Cycle		info	
SEL Full		D0h	01h	0x07 – over 75% full 0x09 – over 90% full 0x0B – 100% full		info	

### 3 Main Sensor Table

Thresholds for threshold based sensors are noted as shown below. Note that only a few of the assertions are actual errors. The repair actions recommendations are only for use when the sensor logs an error condition.

UNC = Upper Non-Critical	
UC = Upper Critical	
UNR = Upper Non-Recoverable	<b>ERROR</b>
LNC = Lower Non-Critical	
LC = Lower Critical	
LNR = Lower Non-Recoverable	<b>ERROR</b>
NR = Non-Redundant	
LF = Low Fuel	
OS = Over Spec	<b>ERROR</b>

Table 3-1: Zeus Sensors

Sensor Name	No.	Sensor Type	Reading Type	Logged Assertions	Logged De-Assertions	Event or Error	Repair Actions
Fuel Gauge, Rack, 1 PS, 110VAC	15h	03h	01h	NR,LF,OS		Error	1.Replace Power Supply 2. Replace Power Backplane
Fuel Gauge, Rack, 1 PS, 220VAC	16h	03h	01h	NR,LF,OS		Error	See above
Fuel Gauge, Rack, 2 PS, both 110VAC	17h	03h	01h	NR,LF,OS		Error	See above
Fuel Gauge, Rack, 2 PS, both 220VAC	18h	03h	01h	NR,LF,OS		Error	See above
Fuel Gauge, Rack, 2 PS, 1-110VAC and 1-220VAC	19h	03h	01h	NR,LF,OS		Error	See above
Fuel Gauge, Tower, 1 PS	1Ah	03h	01h	LF,OS		Error	1.Replace Power Supply 2. Replace Power Backplane
Fuel Gauge, Tower, 2 PS	1Bh	03h	01h	NR,LF,OS		Error	See above
Fuel Gauge, Tower, 3 PS	1Ch	03h	01h	NR,LF,OS		Error	See above
Fuel Gauge, Tower, 4 PS	1Dh	03h	01h	NR,LF,OS		Error	See above
Rack Not Redundant	1Eh	08h	03h	00h – State Deasserted 01h – State Asserted		Warn	1. Check AC cord to power supplies 2. Replace defective power supply.
Tower Not Redundant	1Fh	18h	0Bh	00h – Redundant 01h – Not Redundant		Warn	1. Check AC cord to power supplies

## 4 OEM Sensor List

There are several sensors on the Zeus products which require passing 8 or 16 bits of usually bit mapped OEM event data information for power goods, 12V faults, etc. These are specified in the following table. They are all bit-mapped except for power supply faults which are an 8-bit code.

## 5 BIOS Logged Events

System BIOS is able to communicate with the BMC and log architected events. There are two portions to BIOS logging – POST events, which occur during system power up, and SMI events, which are generally run time errors detected by hardware.

### 5.1 OEM SEL BIOS Entry Definitions

While the IPMI specification defines a wide variety of sensor types and record IDs for possible system events, IBM xSeries servers will log OEM specific messages in the BMC SEL. To provide consistency across all xSeries systems, the OEM record ID and OEM sensor type definitions will remain consistent. The table below will document each OEM record ID and sensor type used by xSeries systems as well as a text description of the event. Outside system software should use this table to provide BMC SEL NLS translations to end users.

Sensor Type	Sensor Type Code	Byte Definitions/Description
OEM POST with Time Stamp	0xC0	Byte 11 POST Error / Event Type 0x00 POST PCI POST Event/Error 0x01 POST PCI Processor Event / Error 0x02 POST Memory Event / Error 0x03 POST Scalability Event / Error 0x04 POST Bus Event / Error 0x05 POST Chipset Event / Error  Byte 12-15 Defined per Error / Event Type in below tables Byte 16 Revision Number Format

Byte	Description	Repair Actions
4	0x02 SMI Memory Event / Error	Info only

5	0x00 Sparing Event	
6	0x01 Sparing Start 2 0x03 Sparing Done 2	
7	Failed Row 1	
8	Failed Row 2	
9	Spare Row 1	
10	Spare Row 2	
11- 15	Reserved	
16	Revision Number = 0x00	

Figure 17-SMI Sparing/RBS 2 SEL Format

Byte	Description	Repair Actions
4	0x02 SMI Memory Event / Error	
5	0x01 Memory Mirroring Failover Occurred (Running from mirrored memory image)	Replace memory DIMM identified by Lightpath LEDs
6-15	Reserved	
16	Revision Number = 0x00	

Figure 18-SMI Mirroring SEL Format

### 5.3.5 SMI FSB Bus Event / Error SEL Format

Byte	Description	Repair Actions
4	0x04 SMI Bus Event / Error	
5	Bus Type 0x00 FSB	
6	0x00 FSB A Fatal 0x01 FSB A NonFatal 0x02 FSB B Fatal 0x03 FSB B NonFatal	1. If fatal, for FSB A, test CPU1&2. Replace failed device. 2. If fatal, for FSB B, test CPU3&4. Replace failed device. 3. Replace CPU card.
7 – 8	FSB FERR or NERR or Zero	
9 – 15	Reserved	
16	Revision Number = 0x00

#### Author Notes:

Sect 1 – from Warren Price, except 1.6 (differences between...) which comes from the BMC\_Zeus\_Spec\_23.doc (Chuck Young/Carl Morrell)

Sect 2 – from BMC Core Spec (these are common to all BMC platforms)  
Sect 3 – from BMC\_Zeus\_Spec\_23.doc (Chuck Young/Carl Morrell) should use latest version.  
Sect 4 – from BMC\_Zeus\_Spec\_23.doc (Chuck Young/Carl Morrell) should use latest version.  
Sect 5 – from BMC\_Zeus\_Spec\_23.doc (Chuck Young/Carl Morrell) should use latest version.  
Sect 6 – from bios\_bmc\_design\_guide.doc (Bill Schwartz) should use latest version.  
All repair actions (Chap 2, 3,4, 5) columns are from the author.
